Neurosciences
MSc/PhD/MD-PhD Program

www.gpneuro.uni-goettingen.de
Letter from the President

Success for a comprehensive research university such as our Georg-August University of Göttingen is rooted in excellent science and its integration into an optimal learning environment to educate competent and critical young academics. I am very glad that our university in cooperation with the local Max-Planck Institutes and the German Primate Center has been able to establish conditions, which make top interdisciplinary science possible in an international setting enabling us all to feel the Göttingen Spirit.

The two international MSc/PhD programs in Neurosciences and Molecular Biology truly have contributed to our continued strive for excellence in science-oriented training both by integrating faculty members from university and non-university institutes across institutional borders and by providing comprehensive services especially for international students on the Göttingen Research Campus. Based on the proven concepts and the experience of these programs the Göttingen Graduate School for Neurosciences, Biophysics, and Molecular Biosciences (GGNB) was established, which is continuously supported by the federal Excellence Initiative since 2007.

The Neuroscience and Molecular Biology programs remain unique within the Graduate School GGNB in offering integrated MSc/PhD curricula with a fast track option which allow excellent BSc graduates to directly enter the PhD phase after successfully absolving the initial 1st year training phase. For over a decade these international programs have been particularly successful in attracting high numbers of worldwide applicants of good academic quality providing the basis for the selection of the very best candidates. New ideas introduced by these programs have meanwhile been adopted by the Georg-August University School of Science (GAUSS) and other graduate schools for the benefit of the entire university.

While maintaining their successful structure the content and focus of the training curriculum of the programs has continuously been adapted to the changing research topics. Consequently, new faculty members are integrated to reflect novel developments in research. They will further ensure optimal individual supervision and up-to-date research-oriented training. Beyond academia both programs keep close contact with the relevant industries to enhance the opportunities of the graduates for a successful professional career in the private sector.

I would very much like to thank all colleagues and institutions for their committed support of these international programs and, last but not least, the German Academic Exchange Service (DAAD), the Lower Saxony Ministry of Science and Culture, and the various generous donors. The Georg-August University of Göttingen will continue to support these programs to promote international exchange at all levels and for further interaction with our partners worldwide.

Prof. Dr. Ulrike Beisiegel

(President of the Georg August University Göttingen)
Letter from the Max Planck Society

The mission of the Max Planck Society is to conduct basic research in science and humanities at the highest level. More than 80 Max Planck Institutes are located on scientific campuses across Germany, most of them close to universities.

Scientific ties between Max Planck Institutes and universities are traditionally strong. In 1998, during the 50th year celebration of the Max Planck Society in Göttingen, the Max Planck Society, together with the Hochschulrektorenkonferenz, launched the International Max Planck Research Schools as a new joint program to further intensify cooperation.

The goals of the International Max Planck Research Schools are

- to attract excellent students from all around the world to intensive Ph.D. training programs in Germany, preparing them for careers in science,

- to integrate Max Planck scientists in top-level scientific training of junior scientists,

- to intensify the ties to the universities owing to the participation of internationally renowned Max Planck scientists in joint teaching activities, and

- to strengthen international relationships by providing individual support to each student and by exposing foreign students to German culture and the German language.

By now, 63 International Max Planck Research Schools have been established involving 82 Max Planck Institutes, 37 German universities and 25 universities abroad. About 3150 PhD students from 112 countries are presently enrolled.

More than 3200 PhD students have graduated to date from an International Max Planck Research School.

Since their foundation in the year 2000, the Göttingen International Max Planck Research Schools in Neurosciences and Molecular Biology have met with extraordinary success. Every year, the programs receive hundreds of applications, with the quality of the students consistently being very high. Most students graduated so far have moved on to postdoctoral positions, many at prestigious international institutions. In the past years, the Göttingen Schools received unanimous acclaim during external evaluations and won national awards. For instance they are the only Life Science Programs within Germany that were selected for the “Top Ten International Master's Degree Courses 2006”. The Schools have also re-shaped the local scientific community, strengthening the ties between the participating institutions, and initiated new scientific collaborations that augment the international reputation of Göttingen as a center of scientific excellence. Furthermore, the Schools served as role models and founding members of the Göttingen Graduate School for Neurosciences, Biophysics, and Molecular Biosciences, thus being instrumental for the continued support by the German Excellence Initiative provided to the university. We hope that in the years to come the students of the International Max Planck Research Schools will be successful in their professional careers. We also hope that they will remember their training period in Göttingen as an exciting and stimulating phase in their lives.

Peter Gruss
President
Max Planck Society

Gregor Eichele
Dean of the IMPRS
Neurosciences
Overview

This yearbook is intended to provide information on the International MSc/PhD/MD-PhD Neuroscience Program in Göttingen, Germany, which was established in 2000. In addition to general information on the program, the yearbook introduces the current year's students, the faculty members, the program committee, and the coordination team.

The program is a member of the Göttingen Graduate School for Neurosciences, Biophysics, and Molecular Biosciences (GGNB), which is funded by the Excellence Initiative of the German Federal and State Governments. It is offered by the University of Göttingen, the Max Planck Institute for Biophysical Chemistry (MPIbpc), the Max Planck Institute for Experimental Medicine (MPIem), the Max Planck Institute for Dynamics and Self-Organization (MPIds), the German Primate Center (DPZ), and the European Neuroscience Institute (ENI). Further to their active participation in the Neuroscience Program, the above mentioned partners closely cooperate in the Cluster of Excellence and DFG Research Center Nanoscale Microscopy and Molecular Physiology of the Brain (CNMPB), the Göttingen Center for Molecular Biosciences (GZMB), the Center for Systems Neuroscience (ZNV), in several collaborative research centers (Sonderforschungsbereiche, SFB), and in interdisciplinary doctoral programs (Graduiertenkollegs, GK).

The International MSc/PhD/MD-PhD Neuroscience Program qualifies students for professional work in the neurosciences. The program is open to students from Germany and from abroad, who hold a Bachelor's degree (or equivalent) in the biosciences, medicine, psychology, physics, or related fields. All courses are held in English. Scholarships are available. The academic year starts in October and is preceded by a three week orientation program. Applications may be submitted until January 15 of the year of enrollment. To ensure a high standard of individual training, the number of participants is limited to 20 students per year.

All students initially participate in one year of intensive course work. This first segment of the program comprises lectures, tutorials, seminars, methods courses, and independent, individually supervised research projects (laboratory rotations). The traditional German structure of academic semesters is not followed. The condensed schedule allows students to accumulate 90 credits (ECTS) within one year, which would normally require three semesters.

Subsequently, two separate segments are offered:

- **PhD Program:** Good to excellent results after the first year qualify for direct admission to a three-year doctoral project in one of the participating research groups. The Master's thesis requirement is waived in this case. After successful defense of a doctoral thesis, the degree Doctor of Philosophy (Ph.D.) or the equivalent title Doctor rerum naturalium (Dr. rer. nat.) is conferred. Students who finished medical school can apply for an MD-Ph.D. title.

- **MSc Program:** Alternatively, students may conclude the program with a Master's thesis, based on six months of experimental scientific research. The degree Master of Science (M.Sc.) is awarded upon successful completion of the Master's thesis.

![Program Flow Chart]
Funding of the Program

The Neuroscience Program thanks the following institutions and funding initiatives, who contributed to the success of the Neuroscience Program:

**DAAD**

German Academic Exchange Service (DAAD), Bonn, Germany, [http://www.daad.de](http://www.daad.de)

*International Degree Programs - Auslandsorientierte Studiengänge (AS)*

**IPP made in Germany**

International Postgraduate Programs – *Internationale Promotionsprogramme (IPP)*

**Max Planck Society for the Advancement of Science**, Munich, Germany, [http://www.mpg.de](http://www.mpg.de)

*International Max Planck Research Schools*

**Ministry of Lower Saxony for Science and Culture**, Hannover, Germany, [http://www.mwk.niedersachsen.de](http://www.mwk.niedersachsen.de)

*Innovationsoffensive*

*Doctoral Programs - Promotionsprogramme*

**Stifterverband für die Deutsche Wissenschaft**

Stifterverband für die Deutsche Wissenschaft, Essen, Germany, [http://www.stifterverband.org](http://www.stifterverband.org)

**Exzellenzstiftung zur Förderung der Max-Planck-Gesellschaft**, Munich, Germany, [http://www.exzellenzstiftung.de](http://www.exzellenzstiftung.de)

**Gemeinnützige Hertie-Stiftung**

Gemeinnützige Hertie-Stiftung, Frankfurt am Main, Germany, [http://www.ghst.de](http://www.ghst.de)
Donors
The Neuroscience Program thanks the following companies for their donations, which were used to financially support students during the first year of studies:

- Bayer AG, Leverkusen, Germany
- Carl Zeiss Lichtmikroskopie, Göttingen, Germany
- Degussa AG, Düsseldorf, Germany
- DeveloGen AG, Göttingen, Germany
- Heka Elektronik GmbH, Lambrecht / Pfalz, Germany
- Hellma GmbH & Co. KG, Müllheim / Baden, Germany
- KWS Saat AG, Einbeck, Germany
- Leica Microsystems GmbH, Bensheim, Germany
- Luigs & Neumann, Ratingen, Germany
- npi electronic GmbH, Tamm, Germany
- Olympus Europa Holding GmbH, Hamburg, Germany
- Roche Diagnostics GmbH, Penzberg, Germany
- Sartorius stedim AG, Göttingen, Germany
- Springer Verlag, Heidelberg, Germany
- Vossius & Partner, München, Germany
Intensive Course Program (First Year)

Throughout the first year, current topics in the neurosciences are covered by
- lectures
- tutorials
- methods courses
- laboratory rotations
- seminars

Lectures and Tutorials

A comprehensive lecture series is organized into a sequence of 4-6 week units. The following topics are taught on an advanced level throughout the first year (36 weeks, 4 hours per week):

A. Neuroanatomy
B. Physiology and Basic Statistics
C. Modelling, Autonomous Nervous System, Pharmacology
D. Molecular Biology, Development, and Neurogenetics
E. Sensory and Motor Systems
F. Clinical Neurosciences and Higher Brain Functions
G. Specialization Seminars and Tutorials

Each lecture is accompanied by a tutorial session, where students meet with a tutor in small groups. Tutorials involve exercises, review of lecture material, and discussion of related topics.
Methods Courses

During the first months of the Neuroscience Program, students participate in a series of methods courses to introduce them to principles and practical aspects of basic scientific techniques and the handling of model organisms. The practical courses and tutorials comprise the following topics:

I  Neuroanatomy
   - comparative development of the vertebrate brain
   - cytology and ultrastructure of the human brain
   - functional neuroanatomy of sensory and motor systems
   - immunocytochemical techniques
   - single neuron staining and recording

II  Physiology and Basic Statistics
   - introduction to medical statistics
   - electrophysiological techniques
   - membrane physiology / synaptic transmission
   - FLIM / Ca-imaging / FCS techniques
   - sensory and behavioral physiology

III  Modelling, Autonomous Nervous System, Pharmacology
   - neuronal modelling
   - behavioral analysis
   - neuroendocrinology / neuropharmacology
   - protein separation techniques

IV  Molecular Biology, Development, and Neurogenetics
   - cell culture methods
   - methods in molecular biology

Laboratory Rotations

Starting in January, every student carries out three independent research projects (laboratory rotations) in participating laboratories. Each project is individually supervised and involves seven weeks of experimental work, followed by one week for data analysis and presentation. For each project, a report must be completed in the format of a scientific publication. The laboratory rotations must cover at least two different subjects.
Seminars

Seminars start in March. The class meets weekly for two hours to discuss two or three student presentations. The presentations are research reports based on work from the laboratory rotations.

Examinations

After the first year of intensive training, all students take one written and two oral Master's examinations. The Master's examinations explore the students' theoretical background in topics covered by lectures and tutorials. All candidates are examined both in the field of anatomy and physiology in two separate oral exams.

PhD Program

Students who have passed the Master's examinations with good or excellent results qualify for direct admission to a three-year doctoral project in one of the participating research groups without being required to complete a Master's thesis first.

The PhD program emphasizes independent research on the part of the students. Doctoral students select three faculty members as their doctoral thesis committee which closely monitors progress and advises students in their research project. Laboratory work is accompanied by seminars and lecture series, a wide variety of advanced methods courses, training in scientific writing and oral presentation skills, courses in intercultural communication, bioethics and research ethics, elective courses, and participation in international conferences or workshops.

At the end of the PhD training program, a doctoral thesis is submitted either in the traditional format, or as a collection of scientific publications in internationally recognized journals along with a general introduction and a discussion of the results. The degree Ph.D. or, alternatively, Dr. rer. nat. will be awarded after the successful defense of the doctoral thesis. Having fulfilled all PhD degree requirements, medical students may apply for the degree of an MD-Ph.D. at the Medical Faculty.
Master’s Program

After the first year of intensive training, students may conclude the program with a six-month thesis project, leading to a Master of Science degree. The thesis project involves experimental work under the supervision of faculty members of the Neuroscience Program. Students have the opportunity to conduct their Master’s thesis project at an affiliated research institution abroad.

Orientation, Language Courses, Social Activities

A three-week orientation prior to the program provides assistance and advice for managing day-to-day life, including arrangements for bank account, health insurance, residence permit, housing, and enrollment. Students have the opportunity to meet faculty members and visit laboratories of the participating institutions. In addition, the orientation program informs students about computing and library facilities, the city and university of Göttingen, sports facilities, and cultural events.

An intensive basic language course in German is offered in cooperation with the Lektorat Deutsch als Fremdsprache to facilitate the start in Göttingen. Additional language courses and social activities accompany the program.

Application, Selection, and Admission 2013

Applicants must hold a Bachelor’s degree or equivalent in biology, medicine, psychology, physics, chemistry, and related fields. Applicants who are not native speakers of English should demonstrate adequate competence of the English language by acceptable results in an internationally recognized test.

In the year 2013, the coordination office received 287 applications from 49 countries.

Monika Chanu Chongtham

EDUCATION

College / University:
Sheffield Institute of Translational Neuroscience

Highest Degree:
M.Sc.

Major Subjects:
Basic Neuroscience, psychiatry and neurodegenerative diseases, computational neuroscience with Bachelors in Chemistry

Lab Experience:
Cell culture, drug testing, western blot, PCR optimisation and sequencing

Projects / Research:
Aug – Sep 2013: Internship - Search of new mutations for Amyotrophic Lateral Sclerosis (ALS). Dr. J. Kirby, Dr. J. Cooper Knock, SITraN, UK
Apr – Aug 2013: Thesis “Pre-clinical development of protein kinase C inhibitors in motor neuron disease”, Dr. A. Grierson, SITraN, UK
May – July 2011: Internship - From signalling pathways to disease through systems analysis: Case study on “Mitochondrial Dysfunction and neuronal death in Alzheimer's disease patients”. Dr. J. Gomes, IIT Delhi, India.

Scholarships:
2013 – 2014: Stipend by the International Max Planck Research School
2012 – 2013: British Council Jubilee Scholarship (International)
2010 – 2012: KVPY fellowship (India)
2009 – 2010: State scholarship for talented students (India)

Alexander Dieter

EDUCATION

College / University:
Goethe-Universität, Frankfurt am Main

Highest Degree:
B.Sc.

Major Subjects:
Life Sciences

Lab Experience:
Cell culture, immunofluorescence, bioacoustics, electrophysiology, behavioral phenotyping

Projects / Research:
Categorization and auditory processing of communication calls in Seba’s short-tailed fruit eating bat Carollia perspicillata

Scholarships:
2013 – 2014: Stipend by the International Max Planck Research School
July – Sep 2013: Rise worldwide – Scholarship for International Research Projects
Aug – Dec 2012: Erasmus Scholarship for studying abroad
Carlos J. Duque Afonso

EDUCATION

College / University:
Autonomous University of Barcelona

Highest Degree:
B.Sc.

Major Subjects:
Biomedical Sciences

Lab Experience:
Basic techniques in molecular and cellular biology, induction and monitoring of EAE mice (a model for Multiple Sclerosis), immunofluorescence staining and confocal microscopy

Projects / Research:
June 2013 – Bachelor thesis: The role of microglia in synaptic plasticity
July – Sep 2012: Summer internship at “Neurobehavioral phenotyping of mouse models of disease” group, CRG, PRBB, Spain.
Mar 2011 – June 2012: Internship at “BBG – Glial research team”, Unit of Medical Histology, Dept. of Cell Biology, Physiology and Immunology, Autonomous University of Barcelona, Spain.
July – Aug 2011: Summer internship at “Alloimmunoregulation” group, Dept. of Oncology and Hematology, University Medical Center Freiburg, Germany

Scholarships:
2013 – 2014: Stipend by the International Max Planck Research School
2011 – 2012: Collaboration scholarship, Autonomous University of Barcelona

Rajaram Ezhilarasan

EDUCATION

College / University:
National University of Singapore

Highest Degree:
B.Sc. (Honors)

Major Subjects:
Life Sciences

Lab Experience:
Molecular biology, protein biochemistry and in vivo electrophysiology

Projects / Research:
2010 – 2013: Role of Arc in memory consolidation
2009 – 2010: Study on the effects of NMDA antagonists on pain behaviour in rats

Scholarships:
2013 – 2014: Stipend by the International Max Planck Research School
SIA NOL undergraduate scholarship to pursue my undergraduate degree
Oli Abate Fulas

EDUCATION
College / University:
Hawassa University College of Medicine and Health Sciences

Highest Degree:
Doctor of Medicine

Major Subjects:
Medicine

Lab Experience:
Basic lab techniques

Scholarships:
2013 – 2015: Erasmus Mundus Scholarship

Michael Feyerabend

EDUCATION
College / University:
University of Cologne

Highest Degree:
B.Sc.

Major Subjects:
Neurosciences

Lab Experience:
Basic techniques in biochemistry, molecular biology and histology; patch clamp recording, behavior analysis, life cell imaging and working with cell cultures

Projects / Research:
2013: Analysis of neural cGMP using FRET-based life cell imaging, bachelor thesis, University of Tübingen, Interfakultäres Institut für Biochemie, Feil lab
2012: Research internship at the Jackson Laboratory, Zhang lab, Bar Harbor, USA. Investigated the circuitry of the cerebral cortex via conditional knock-outs and whole cell recordings

Scholarships:
2010 – 2014: Scholarship from the Friedrich-Naumann-Foundation
Georg Hafner

EDUCATION

College / University:
University of Salzburg

Highest Degree:
B.Sc.

Major Subjects:
Biology, Psychology

Lab Experience:
Techniques in cellular and molecular biology, cell culture, EEG/ERP, tDCS

Projects / Research:
Mar – July 2013: “Studying existential threats with ERPs: Late components provide a quantitative measure of terror management effects”, Bachelor thesis, Dept. of Social Psychology

Nov – Dec 2012: Ferritin-induced cell death of rat hepatocytes, Dept. of Cell Biology

Scholarships:
2013 – 2014: Stipend by the International Max Planck Research School
2012: Scholarship for achievement from the University of Salzburg

Md. Rezaul Islam

EDUCATION

College / University:
University of Dhaka

Highest Degree:
M.Sc. in Biochemistry and Molecular Biology

Major Subjects:
Biochemistry, molecular biology, neuroscience, immunology, bioinformatics

Lab Experience:
Primer designing, molecular cloning, conventional PCR, realtime PCR, molecular docking

Projects / Research:
miR166 and miR167, key regulatory mediators of salt stress in plants, downregulate their corresponding target genes in Corchorus olitorius (Master’s Thesis)

2011, 2012, 2013: Accelerated Evolution of Brain specific microRNA locus in Homo sapiens; A computational assay to design an epitope-based peptide vaccine against chikungunya virus; In silico prediction and conservancy analysis of promiscuous epitopes in human adenovirus HAdV-65; Structural, functional and molecular docking study to characterize GMI1 from Arabidopsis thaliana

Scholarships:
2013 – 2015: Erasmus Mundus Scholarship
2008 – 2011: Sumitomo Corporation, Japan Scholarship
2005 / 2007: Bangladesh Government Scholarship
Sebastian Jähne

EDUCATION

College / University:
University College Dublin (UCD)

Highest Degree:
B.Sc. (honours)

Major Subjects:
Biochemistry and molecular biology

Lab Experience:
Basic techniques in biochemistry & molecular biology, cell culture techniques, PCR methods, ELISA, basics of FACS, protein purification using IMAC, bacterial transformations, site directed mutagenesis, subcellular fractionation of rat brain, radioactively labeled serotonin uptake and release assays, western blotting

Projects / Research:
Jun – Aug 2012: “Mutagenesis of Serpin B3 reactive centre loop to generate improved inhibitors of cathepsin k and parasitic cysteine proteases”, Dr. M. Worrall, UCD Conway Institute

Scholarships:
2013 – 2014: Stipend by the International Max Planck Research School

Lina María Jaime Tobón

EDUCATION

College / University:
Universidad de Los Andes

Highest Degree:
B.Sc.

Major Subjects:
Biology, Microbiology

Lab Experience:
Techniques in molecular, cellular biology, microbiology and protein chemistry

Projects / Research:
July – Aug 2013: “Characterization of a new member of the Sec1/Munc18-like protein family”. Summer internship at “Molecular mechanism of neuronal secretion” Research Group, Université de Lausanne, Switzerland
Aug – Dec 2012: “Comparative structural analysis of CagA associated with high and low pathogenic strains of Helicobacter pylori”. Molecular Diagnostics and Bioinformatics Laboratory (LDMB), Universidad de Los Andes, Colombia

Scholarships:
2013 – 2015: Erasmus Mundus Scholarship
2008 – 2012: “Quiero Estudiar” Scholarship, Universidad de Los Andes, Colombia
Thomas Offner

EDUCATION

College / University:
Friedrich-Alexander-Universität Erlangen-Nürnberg

Highest Degree:
B.Sc.

Major Subjects:
Molecular Medicine

Lab Experience:
In situ hybridization, confocal microscopy, image analysis and processing, RNA and protein biochemistry. Animal models: mouse, C.elegans, E.coli

Projects / Research:
- Mar 2012 – Apr 2012: Analysis of ATX2 overexpression in motor neurons of C.elegans via optogenetic assays (Gottschalk, BMLS Frankfurt)
- Apr 2010 – May 2010: Purification and crystallization of FeoB soluble domain orthologs (Kühlbrandt, MPI Frankfurt)

Scholarships:
- 2013 – 2014: Stipend by the International Max Planck Research School
- 2009 – today: e-fellows stipend
- Karl von Frisch Abiturientenpreis (VBIO)

Özge Demet Özçete

EDUCATION

College / University:
Bogazici University

Highest Degree:
B.Sc. (honours)

Major Subjects:
Molecular Biology and Genetics

Lab Experience:
PCR, gel electrophoresis, DNA cloning, cell culture, confocal & fluorescent microscopy, western blot, protein purification, bioinformatics, immunohistochemistry, in vivo studies with Danio rerio

Projects / Research:
- 2011 – 2013: “Effects of ATXN2 polyQ expansion on ALS risk in the Turkish cohort” Neurodegeneration Research Laboratory, Bogazici University, Istanbul, Turkey; “TAT-fused delivery of AMPK domains into living cells”, D. Neumann, Dept. of Molecular Genetics, Maastricht University, The Netherlands; “Cloning and purification of NLRP13 subdomains”, Apoptosis and Cancer Immunology Laboratory / “Birth and Death of Olfactory Sensory Neurons in Danio Renio”, Fuss Lab, Bogazici University, Istanbul, Turkey

Scholarships:
- 2013 – 2014: Stipend by the International Max Planck Research School
- 2009 – 2013: Undergraduate Science Scholarship by the Scientific and Technological Research Council of Turkey (TUB TAK)
Foteini Paraskevopoulou

EDUCATION

College / University: National and Kapodistrian University of Athens

Highest Degree: B.Sc.

Major Subjects: Biology

Lab Experience:
Cell culture, molecular & biochemical techniques (SDS-PAGE electrophoresis, Western blot analysis, PCR, DNA and protein extraction), electron microscopy, tissue collection for protein analysis and immunohistochemistry, immunofluorescence. Basic techniques in microbiology, immunology, inorganic and organic chemistry and ecology

Projects / Research:
2013: Research project “Analysis of amyloid deposition in the hippocampus and cerebral cortex of APP/PS ApoE+/+ transgenic mouse model.”, Biomedical Research Foundation of the Academy of Athens, Dr. S. Georgopoulos.

Scholarships:
2013 – 2014: DAAD Study Scholarship for Graduates of All Disciplines

Luis Giordano Ramos Traslosheros López

EDUCATION

College / University: Universidad Autónoma de Nuevo León (UANL)

Highest Degree: B.Sc.

Major Subjects: Physics

Lab Experience:
Basic techniques in physics, chemistry, plant electrophysiology and fiber optics

Projects / Research:
2012: Electrical impedance spectroscopy study of the Mimosa pudica l. plant and its equivalent circuit. UANL. Prof. F. Hernández C.
2012: Dynamical study of networks of QIF neurons exponentially coupled. Prof. F. Wolf, Max Planck Institute for Dynamics and Self-Organization
2010 – 2011: Construction of a remote ultrasensitive laser microphone based on fiber optics. UANL. Prof. R. Selvas A

Scholarships:
2013 – 2014: Stipend by the International Max Planck Research School
2010 / 2011: JAE Intro “Introduction to Research” Scholarship, Spanish National Research Council (CSIC)
Rafael Rinaldi Ferreira

EDUCATION

College / University:
State University of Maringá (Universidade Estadual de Maringá)

Highest Degree:
B.Sc.

Major Subjects:
Pharmacy

Lab Experience:
Induced brain ischemia surgery, basic molecular biology techniques including PCR and RNA synthesis, flow cytometry, basic electrophysiology (voltage clamp)

Projects / Research:
2012: Bachelor thesis: Analysis of the traffic of human K⁺ voltage-gated channel Ether-à-go-go (hEag1) sub-fragments to the cell membrane
2010 – 2011: Effects of global and transitory cerebral ischemia in mice on aversive memory evaluated in step-down task

Scholarships:
2013 – 2014: Stipend by the International Max Planck Research School
2012: Scholarship from the Science without Borders Program (linked to the Brazilian Ministry of Science and Technology) Ministry of Education
2008 – 2012: Scholarship from Tutorial Education Program (linked to the Brazilian Ministry of Education)

Sura Saleh

EDUCATION

College / University:
Faculty of Pharmacy, Damascus University

Highest Degree:
B.Sc.

Major Subjects:
Pharmacology, Pharmaceutical Chemistry

Lab Experience:
Basic lab experience, culturing and transfection of hippocampal neurons, electrophysiological techniques

Projects / Research:
2011: “Towards Elucidation the Pathogenesis of Depression”, Bachelor’s Thesis, Damascus University, Syria (Dr. M. Al-Buhtori)
2013: “Calcium Dependency of SytIV and its effect on BDNF release”, Practical Internship in the Trans-synaptic Signaling Group, European Neuroscience Institute, Göttingen, Germany (Dr. C. Dean)

Scholarships:
2013 – 2014: Stipend by the International Max Planck Research School
Francesca Schönsberg

EDUCATION

College / University: University of Padua

Highest Degree: B.Sc.

Major Subjects: Molecular Biology, Chemistry and Biochemistry, methods of analysis and applications of Biotechnology

Lab Experience: Basic lab technical skills (electrophoresis, PCR, extraction of DNA, microscopy, NMR and IR analysis, construction of cDNA library

Projects / Research:
2013: “The regulation of miRNA in gene expression: from pseudo-ceRNA to circ-ceRNA.” Bachelor thesis (theoretical dissertation), Dept. of Biology, University of Padua (supervisor Prof. Pietro Benedetti)

Scholarships:
2013 – 2015: Erasmus Mundus Scholarship
2010 / 2011: Scholarship for University, “Memorial Maestro Elio Todeschi”, Cassa Rurale di Rovereto

Paromita Sen

EDUCATION

College / University: Carleton College

Highest Degree: B.Sc.

Major Subjects: Biology

Lab Experience:
2011– 2013: Research Assistant, School of Medicine, National Univ. of Singapore
June 2009: Institute of Medical Biology, A Star

Projects / Research:
2011– 2013: Studying the significance of efflux pumps in multidrug resistant Acinetobacter baumannii
2013: IM Amin, GE Richmond, P Sen, TH Koh, LJ Piddock, & KL Chua A Method for generating marker-less gene deletions in multidrug-resistant Acinetobacter baumannii. BMC Microbiology, 13(1), 158
June 2009: Understanding post-transcriptional regulations in pluripotent stem cells

Scholarships:
2013 – 2014: Stipend by the International Max Planck Research School
2007 – 2011: Davis Scholarship
Michael Siebrecht

EDUCATION
College / University:
Georg August University Göttingen
Highest Degree:
B.Sc.
Major Subjects:
Biology
Lab Experience:
Electrophysiology (extracellular recordings), immunohistochemistry, optical imaging
Projects / Research:
Analysis of map order in retinotopic maps of mice and zebra finches (bachelor project Göttingen, 2013)
The pharmacology of mice sensory hair cells in the outer ear (IMS Aberdeen, 2012)
The role of BACE in Alzheimer’s disease (IMS Aberdeen, 2012)
Scholarships:
2013 – 2014: Stipend by the International Max Planck Research School

Sebastian Sydlik

EDUCATION
College / University:
Maastricht University
Highest Degree:
B.Sc.
Major Subjects:
Biomedical Life Sciences
Lab Experience:
Electrophysiological techniques
Projects / Research:
2013: Postsynaptic pH in Drosophila larvae motor junctions. Dept. of Physiology, Development and Neuroscience, University of Cambridge, UK
2013: Extracellular Na+ and K+ in the 0 mM Mg2+/bicuculline induced model of epilepsy in acute mice brain slices. Bachelor Thesis. Institute of Neurobiology, Heinrich-Heine-University, Düsseldorf, Germany
2012: Presynaptic pH and vesicle fusion in Drosophila larvae neurones. Dept. of Physiology, Development and Neuroscience, University of Cambridge, UK
2012: Chronic phosphodiesterase type 2 inhibition improves memory in the AP-Pswe/PS1dE9 mouse model of Alzheimer’s disease. Faculty of Psychology and Neuroscience, Maastricht University, The Netherlands
Scholarships:
2013 – 2014: Stipend by the International Max Planck Research School
2012: Top 3% Grant Maastricht University, Amgen Scholars Program Europe

Mathias Bähr

Professor of Neurology

• 1985 MD, University of Tübingen Medical School, Training in Neurology at University Hospitals in Tübingen and Düsseldorf
• DFG and Max Planck Fellow at the Max Planck Institute for Developmental Biology Tübingen and at the Department of Anatomy and Cell Biology, Washington University St.Louis
• Schilling-Foundation Professor for Clinical and Experimental Neurology, University of Tübingen
• Director at the Department of Neurology, University of Göttingen since 2001

Major Research Interests

Neuronal cell loss is not only a major feature of human neurodegenerative diseases like Parkinson’s disease (PD), Alzheimer’s disease (AD) or stroke, but can also be observed in neuroinflammatory conditions like Multiple Sclerosis (MS) or after traumatic lesions, e.g. of the optic nerve. We examine the cellular and molecular mechanisms of neuronal dysfunction and neuronal cell death in animal models of the respective disorders with the ultimate goal to detect new targets for a therapeutic neuroprotective intervention.

In PD for example, a multidisciplinary research team with our participation in the area C2 of the CMPB examines the role of α-synuclein aggregation for dopaminergic dysfunction and cell death and characterizes other disease related proteins in order to develop new neuroprotective strategies. To that end we use AAV viral gene transfer to express different disease-associated and design mutants of α-synuclein in the nigrostriatal system of rodents.

In the recent years it became also clear that axonal and neuronal loss do not only occur in classical neurodegenerative disorders but also in immune-mediated diseases like MS. To study this issue in more detail we have developed a model system of MS in rodents that reproducibly leads to optic neuritis, one of the most common early manifestations of MS. To monitor disease course we have established electrophysiological measurements like visually evoked potentials (VEP), electroretinogramm (ERG) and optical coherence tomography (OCT) that allow us to correlate onset, course and outcome of disease with and without therapy with histomorphological and molecular analyses. The aim is to describe in detail the molecular pathophysiology that leads to axonal and neuronal loss and to develop new therapeutic strategies, some of which have already been translated into proof of concept studies in human patients.

Selected Recent Publications

Thomas Bayer

Professor of Molecular Psychiatry

- 1984 – 1989 Diploma in biology, University of Stuttgart and Whitney Lab Florida
- 1989 – 1993 PhD at the University of Cologne (PhD Thyssen Graduate School)
- 1993 Postdoctoral Research Fellow, University of Cologne, Cologne
- 1993 – 1997 Postdoctoral Research Fellow, Institute of Neuropathology, University of Bonn Medical Center, Bonn
- 1997 – 2002 Lab leader, Department of Psychiatry, University of Bonn Medical Center, Bonn
- 2002 – 2007 Head of Neurobiology Lab, University of Saarland Medical Center, Homburg
- 2004 Appointment to apl Professor at the University Medical Center Saarland
- 2007 – present University Professor in “Molecular Psychiatry” at the Georg-August-University Göttingen, University Medicine Göttingen
- Personal tutor of the Studienstiftung at the Georg-August-University Göttingen

Major Research Interests

pathogenesis of Alzheimer’s disease, neuronal cell death mechanisms, preclinical proof-of-concept studies; characterization and development of mouse models for Alzheimer’s disease (neuropathology, anatomy, biochemistry, behaviour tests), preclinical therapy studies in mouse models, blood and CSF biomarker analysis, coordination and design of a phase II clinical study with Alzheimer’s disease patients.

Selected Recent Publications

Nils Brose

Professor, Director at the Max Planck Institute for Experimental Medicine

- Undergraduate studies in Biochemistry, Eberhard Karls University, Tübingen, Germany (1981 – 1985)
- MSc in Physiology with Marianne Fillenz, University of Oxford, Oxford, UK (1987)
- PhD in Biology with Reinhard Jahn, Ludwig Maximilians University, Munich, Germany (1990)
- Postdoctoral training with Stephen F. Heinemann (Salk Institute, La Jolla, CA, USA) and Thomas C. Südhof (University of Texas Southwestern Medical Center, Dallas, TX, USA) (1991 – 1995)
- Research Group Leader, Max Planck Institute for Experimental Medicine, Göttingen, Germany (1995 – 2001)
- Director, Department of Molecular Neurobiology, Max Planck Institute of Experimental Medicine, Göttingen, Germany (since 2001)

Major Research Interests

Research in the Department of Molecular Neurobiology focuses on the molecular mechanisms of nerve cell development and synapse formation and function in the vertebrate central nervous system. We combine biochemical, morphological, mouse genetic, behavioral, and physiological methods to elucidate the molecular basis of nerve cell differentiation, synapse formation and transmitter release processes. Our work in the field of nerve cell development focuses on the role of protein ubiquitination and SUMOylation in cell polarity formation, cell migration, and neuritogenesis. The synaptogenesis research in our group concentrates on synaptic cell adhesion proteins, their role in synapse formation, and their dysfunction in neuropsychiatric diseases. Studies on the molecular mechanisms of neurotransmitter release focus on components of the presynaptic active zone and their regulatory function in synaptic vesicle fusion.

Selected Recent Publications

Wolfgang Brück

Professor of Neuropathology

- 1986 MD Johannes Gutenberg University in Mainz, 1994 national boards in neuropathology
- 1996 – 2002 Associate professorships for neuropathology at the University of Göttingen and the Charité in Berlin
- Since 2002 full professor and director of the Department of Neuropathology, University of Göttingen

Major Research Interests

- Immunopathology of multiple sclerosis
- Brain-specific mechanisms of immune response in multiple sclerosis
- Axonal damage in inflammatory demyelination and mechanisms of remyelination
- Mechanisms and consequences of microglial activation

Selected Recent Publications

Camin Dean

Group Leader Trans-synaptic Signaling

• 2003: Ph.D. University of California, Berkeley, and Columbia University
• 2004 – 2010: Postdoctoral Fellow, University of Wisconsin, Madison
• since 2010: Group Leader, European Neuroscience Institute- Göttingen

Major Research Interests

Our lab is interested in the mechanisms by which individual synapses, neurons and circuits dynamically adjust their transmission properties in response to changes in neuronal network activity. To accomplish this, neurons signal to each other not only unidirectionally via classical pre to post-synaptic transmission, but also bidirectionally via pre or post-synaptic release of neuropeptides and neurotrophins. This bidirectional channel of communication is essential for the modulation of synapse and circuit strength, via regulation of distinct membrane fusion events on both sides of the synapse, including synaptic vesicle exocytosis, post-synaptic receptor recycling, and adhesion molecule recycling. We investigate the mechanisms by which these trans-synaptic signaling events are regulated, at the level of single synapses, single neurons and neuronal networks, using a combination of live imaging approaches, electrophysiology, and biochemistry in neuronal cell culture and brain slices. Our overall goal is to understand how neurons communicate changes in activity to affect circuit function, and ultimately behavior, during learning and memory acquisition, or to counteract aberrant brain states such as seizure activity.

Selected Recent Publications

Thomas Dresbach

Professor of Anatomy

- Dr.rer.nat. (Biology), 1996, University of Bonn
- DFG research fellow and postdoctoral Fellow with E. Gundelfinger at the Leibniz Institute for Neurobiology, 1997 – 2003
- Teacher and independent research group leader at the University of Heidelberg, Institute for Anatomy and Cell Biology (Dept. Prof. Dr. J. Kirsch), 2003 – 2010
- Professor at the School of Medicine, University of Göttingen, 2010

Major Research Interests

Our group studies synapse formation with particular focus on the biogenesis of presynaptic nerve terminals. Our goal is to understand the mechanisms of synaptogenesis in enough detail to pinpoint molecular causes of synaptopathies. We study neuronal cultures to unravel fundamental mechanisms operating at the heart of synaptogenesis, and we have begun to study specialized synapses such as the giant synapses of the mammalian auditory system to determine how these mechanisms act together to generate the remarkable specification and heterogeneity of synapses in the brain.

Using live imaging, molecular biological and ultrastructural approaches, we currently analyze
- the role of novel, vertebrate-specific presynaptic proteins in synaptic function
- the trafficking and assembly of synaptic organelles and protein complexes
- the transsynaptic signalling events controlling presynaptic differentiation.

These efforts should help us understand both the common principles by which the various types of synapses are generated, and how they are fine-tuned for specific tasks, such as a particular strength, reliability or adaptivity.

Selected Recent Publications

Hannelore Ehrenreich

Professor of Neurology and Psychiatry

- 1981 Doctor of veterinary medicine, University of Munich
- 1983 Elective Period, University of Newcastle-upon-Tyne, England
- 1985 Guest Lecturer, University of the Philippines, Manila
- 1985 – 1986 Assistant, Department of Internal Medicine, University of Munich
- 1987 Graduation (Medicine), University of Munich
- 1987 – 1988 Assistant, Department of Neurology, University of Munich
- 1989 Doctor of Medicine, University of Munich
- 1989 – 1991 Guest Scientist (BMBF grant) NIAID, NIH, Bethesda, MD, USA
- 1992 – 1994 Assistant, Departments of Neurology and Psychiatry, University of Göttingen
- 1994 Habilitation (Neurology and Psychiatry)
- 1994 – present Head, Division of Clinical Neuroscience, MPIEM
- 2000 – 2002 Vice President, University of Göttingen
- 2008 Adjunct Professor of Biology and Psychology, University of Göttingen

Major Research Interests

Translational Neuroscience
(1) Molecular-cellular basis of neuropsychiatric diseases with focus on mechanisms of disease and on endogenous neuroprotection/neuroregeneration (erythropoietin/EPO variants)
(2) Preclinical and clinical research on neuroprotection/neuroregeneration in acute (ischemia/hypoxia, neurotrauma) and chronic diseases (schizophrenia, autism, MS, alcoholism)
(3) Phenotype-based genetic association studies (PGAS) as a tool to understand the genotype contribution to (disease) phenotypes

Selected Recent Publications

Gregor Eichele

Professor, Director at the Max Planck Institute for Biophysical Chemistry

- 1976 – 1980 Ph.D. protein crystallography (J. N. Jansonius, Biocenter, University of Basel, Switzerland)
- 1981 – 1984 Postdoctoral training in Developmental Biology (B. M. Alberts, University of California, San Francisco)
- 1985 – 1989 Assistant Professor of Cellular and Molecular Physiology, Harvard Medical School, Boston, USA
- 1989 – 1990 Associate Professor of Cellular and Molecular Physiology, Harvard Medical School, Boston, USA
- 1991 – 1992 Associate Professor of Biochemistry, Baylor College of Medicine, Houston, USA
- 1992 – 1998 Professor of Biochemistry and Neuroscience, Baylor College of Medicine, Houston, USA
- 1998 – 2006 Director at the Max Planck Institute of Experimental Endocrinology, Dept. of Molecular Embryology, Hanover, Germany
- 2006 – Director at the Max Planck Institute of Biophysical Chemistry, Dept. Genes and Behavior, Goettingen, Germany

Major Research Interests
Dynamic interplay between gene expression, brain development and architecture and behaviour.

Selected Recent Publications

André Fiala

Professor of Molecular Neurobiology of Behavior

- 2008 Professor of Molecular Neurobiology of Behavior, University of Göttingen
- 2008 Habilitation in Neurobiology and Genetics, University of Würzburg
- 2001 – 2008 Research Assistant, University of Würzburg
- 2000 – 2001 Research Fellow, Memorial Sloan-Kettering Cancer Center, New York
- 1996 – 1999 PhD student, Free University of Berlin
- 1996 Degree (Diploma) in Biology, Free University of Berlin

Major Research Interests

We study neuronal mechanisms underlying olfaction, learning and memory, and goal-directed behavior using the model organism Drosophila melanogaster. The fruit fly *Drosophila* offers the advantage of expressing transgenes in almost any population of it’s about 100,000 neurons. Transgenes used by us are, for example, fluorescent sensor proteins that allow us to monitor the spatio-temporal activity of neurons, or light-sensitive proteins by which neuronal activity can be stimulated through illumination. Using these optogenetic techniques in combination with behavioral analyses we aim at unraveling the functioning of dedicated neuronal circuits, and how these circuits contribute to optimizing behavior. In addition, molecular mechanisms underlying learning and memory processes are investigated.

Selected Recent Publications

André Fischer

Group Leader Laboratory for Aging and Cognitive diseases

• 2002: Dr. rer. nat.(PhD). University Goettingen/Max Planck Institute for Experimental Medicine, Germany
• 2003 – 2006: Postdoctoral Associate in the lab of Li-Huei Tsai; Harvard Medical School, Department of Pathology, Boston, USA; Picower Center for Learning and Memory, M.I.T, Cambridge, USA
• since 2006 independent group leader at the European Neuroscience Institute (ENI) in Goettingen

Major Research Interests

Our group aims to understand the molecular mechanisms underlying learning and memory processes under physiological and pathological conditions. To this end we combine molecular, biochemical, pharmacological and behavioral approaches using mice as model organisms.

We are particularly interested to understand cognitive impairment associated with normal aging as well as the pathogenesis of mental and neurodegenerative diseases, such as anxiety disorders and Alzheimer’s disease.

Using animal models we deeply aim to identify therapeutic strategies that would help to reinstate neuroplasticity, learning behavior and the retrieval of lost long-term memories in patients suffering form such devastating diseases.

Selected Recent Publications

Alexander Flügel

Professor of Neuroimmunology

- 1993 MD Ludwig-Maximilians-University (LMU) Munich
- 2002 – 2007 Group leader at the Institute of Neuroimmunology, Max-Planck-Institute for Neurobiology, Martinsried, Munich
- 2008 Associate professor for Experimental Immunology at the Institute for Immunology, LMU Munich
- since 12/2008 Full professor and director of the Department of Neuroimmunology / Institute for Multiple Sclerosis Research, University of Göttingen

Major Research Interests

- Neuroimmunology
- T cell biology
- Intravital imaging

The focus of my interest lies on the mechanisms and factors that allow T cells to enter the central nervous system, to communicate in this milieu and to influence the brain tissue.

My colleagues and I pursue the following aims, i) development of new models and tools to study CNS autoimmunity; ii) revealing the basics of pathogenesis in (auto-)immune diseases of the nervous system; iii) deducing and developing new therapeutical approaches; and iv) analyzing the mechanisms of action for (adverse) effects of new therapeutical procedures.

Selected Recent Publications

Jens Frahm

Professor, Director at the Max Planck Institute for Biophysical Chemistry, Biomedizinische NMR Forschungs GmbH (not-for-profit)

- 1974 Diploma in Physics, Univ. of Göttingen
- 1977 Doctorate in Physical Chemistry, Univ. of Göttingen
- 1977 – 1982 Postdoctoral Researcher, MPI for Biophysical Chemistry
- since 1993 Director, Biomedizinische NMR Forschungs GmbH (not-for-profit, based on group’s patents)
- 1994 Habilitation, Faculty of Chemistry, Univ. of Göttingen
- since 1997 Adjunct Professor, Faculty of Chemistry, Univ. of Göttingen
- since 2011 External Scientific Member, MPI for Dynamic and Self-Organization

Major Research Interests

- Development and biomedical applications of magnetic resonance imaging (MRI): noninvasive studies of structure and function at the system level (animals and humans)
- Methodology: non-Cartesian MRI, parallel MRI, numerical reconstruction techniques, real-time MRI, cardiovascular MRI
- Human neuroscience: functional neuroimaging, neuro-feedback, fiber tractography
- Animal studies: models of human brain disorders, nonhuman primates, genetically modified mice

Selected Recent Publications

Tim Friede

Professor of Biostatistics

- 1998 Dipl.-Math. (Master's degree in Mathematics), University of Karlsruhe, Germany
- 2001 Dr.sc.hum. (PhD), University of Heidelberg, Germany
- 2004 – 2006 Expert Statistical Methodologist, Novartis Pharma AG, Basel, Switzerland
- 2006 – 2009 Associate Professor of Medical Statistics, University of Warwick, UK
- since 1/2010 Professor of Biostatistics and Director, Dept. of Medical Statistics, University Medical Center Göttingen

Major Research Interests

Clinical biostatistics including designs for clinical trials (in particular flexible adaptive designs) and systematic reviews / meta-analyses.

Selected Recent Publications

Theo Geisel

Professor of Theoretical Physics
Director, Max Planck Institute for Dynamics and Self-Organization
Coordinator, Bernstein Center for Computational Neuroscience

- Dr. rer. nat., University of Regensburg (1975)
- Professor of Theoretical Physics, Universities of Würzburg (1988 - 1989), Frankfurt (1989 – 1996), and Göttingen (since 1996)
- Director, Max Planck Institute for Dynamics and Self-Organization, Göttingen (since 1996)

Major Research Interests

How do the myriads of neurons in our cortex cooperate when we perceive an object or perform another task? How do they self-organize in the preceding learning process? Questions like these address the complex dynamics of spatially extended and multicomponent nonlinear systems, which still reserve many surprises. In networks of sufficiently many spiking neurons e.g. we find unstable attractors, a phenomenon which would neither have been guessed nor understood without mathematical modelling and which many physicists consider an oxymoron. They can provide a neuronal network with a high degree of flexibility to adapt to permanently changing tasks. The tools and mathematical methods developed in studies of chaotic behaviour in the past can now help us clarify the dynamics and function of complex networks and spatially extended systems and reveal the biological role of dynamical phenomena like unstable attractors.

These methods lend themselves to applications in neuroscience from the level of single cells to the level of cell assemblies and large cortical networks, from the time scales of action potentials (milliseconds) to the time scales of learning and long-term memory (up to years). My work in the past has dealt among others with studies of stochastic resonance of single neurons under periodic and endogenous stimulation, detailed investigations of the properties, functions, and conditions of neuronal synchronization, and the development of neuronal maps in the visual cortex. We have elucidated the influence of the network topology on synchronization and other dynamical properties and demonstrated the existence of speed limits to network synchronization due to disordered connectivity. Besides, I am also focusing on other applications of nonlinear dynamics, e.g. for quantum chaos in semiconductor nanostructures and in mathematical models for the description and forecast of the spread of epidemics.

Martin Göpfert

Professor for Cellular Neurobiology

- 2008 Full Professor for Cellular Neurobiology, University of Göttingen
- 2008 Associate Professor for Molecular Biology and Biophysics of Sensory Systems, University of Cologne
- 2002 – 2003 Royal Society University Research Fellow, School of Biological Sciences, University of Bristol
- 1998 – 2002 DAAD and Leopoldina Research Fellow, Dept. Neurobiology, University of Zürich and School of Biological Sciences, University of Bristol
- 1998 Degree in Biology, University of Erlangen-Nürnberg

Major Research Interests

Our group studies fundamental processes in hearing. By combining mechanical measurements with genetics, molecular biology, immunohistochemistry, electrophysiology, calcium imaging, and biophysical modelling, we are trying to decipher how molecular processes shape the performance of an ear. Our preferred model system is the hearing organ of the fruit fly *Drosophila melanogaster*, the auditory sensory cells of which share conserved molecular modules with the hair cells in our ears.

Our work has uncovered striking parallels between fly and vertebrate hearing, including the functional equivalence of the auditory transduction and adaptation machineries, the motility of auditory sensory cells, transducer-based force generation, and the expression of homologous genes. Our work also provided first insights into the diverse roles of – and interactions between – transient receptor potential (TRP) ion channels in hearing, and a model of TRP-function in the fly’s auditory system has been devised. Using a novel electrostatic actuation method, we were able to identify hair cell-like signatures of transducer gating and adaptation in the fly’s auditory mechanics and could show that a simple transduction model as proposed to describe hair cell mechanics comprehensively explains the macroscopic behaviour of an ear. Based on these findings, we are currently devising a computational model that allows for the high-throughput characterization of genetic hearing defects. Candidate genes for hearing, in turn, are narrowed down by expression profiling using whole-genome microarrays. By testing how these genes contribute to auditory function and performance, we aim for a comprehensive molecules-to-system description of the functional workings of an ear.

- Postdoctoral training with Haim Sompolinsky, Interdisciplinary Center for Neural Computation, Hebrew University of Jerusalem, Israel (2005 – 2011)
- Max Planck Research Group Leader, Theoretical Neuroscience (since 2011)

Major Research Interests

We use analytical and numerical modeling techniques to identify the computational principles underlying spike based information processing and learning in central nervous systems and to understand how these principles are implemented by biological processes. Specifically, we focus on the role of action potential timing in subserving sensory neuronal representations and computation as well as in controlling synaptic plasticity. Projects center around the recently developed tempotron family of spiking neuronal network models and cover a broad range of topics including mathematical analyzes of information processing in spiking neuronal networks, spike-based learning in single and multi-layer neuronal networks, sensory spike data analysis, temporal processing with short term synaptic dynamics, as well as applied development of visual and speech processing systems.

Role of plasma factors as endogenous signals for microglial cells

Selected Recent Publications

Ralf Heinrich

Professor of Molecular Neuropharmacology of Behavior

• Dr. rer. nat., University of Göttingen, 1995
• Postdoctoral fellow, Harvard Medical School, Boston, USA, 1997 – 1999

Major Research Interests

Behavior is the product of complex interactions between various types of neurons that integrate external sensory information with internal physiological states. Motivational systems in general bias an organism to perform most useful actions to secure survival and reproduction by influencing the initiation, intensity, direction and persistence of behaviors. Our lab is especially interested in central nervous and humoral mechanisms underlying the selection and adaptation of actions that are most appropriate for the particular situation an animal encounters. We study the neurochemical mechanisms underlying motivational states in behavior with a combination of neuroethological, pharmacological, electrophysiological, histochemical and immunocytochemical methods and apply these to intact animals, reduced preparations and cultured cells of various invertebrate species.

Our research interests include questions on the evolution of pharmacological signals, central nervous and humoral systems and sensory organs by comparison of various invertebrate and vertebrate species. Since invertebrates offer unique advantages over more complex nervous systems of vertebrates and especially mammals (e.g. a smaller number of neurons in the central nervous system, individually identifiable neurons and rather limited repertoires of behaviors), we select the most suitable and experimentally accessible preparation from various phylogenetic groups including insects (locusts, grasshoppers, fruitflies), crustaceans (marbled crayfish) and annelids (medical leech).

Molecular Mechanisms Of Synaptic And Non-Synaptic Modulation

Biogenic amines such as serotonin, dopamine, histamine or octopamine (OA), the pendant of norepinephrine in invertebrates, are widely distributed within the animal kingdom. These evolutionary conserved neuroactive substances are involved in the control of vital functions in both vertebrates and invertebrates. Biogenic amines often initiate long-lasting neuro-modulatory effects in their targets, which is due to diffusion following non-synaptic release activating G-protein coupled to intracellular pathways. My work is focussed on the investigation of cellular and molecular mechanisms underlying the modulation of neuronal signaling in identified networks in invertebrate model systems. Using electrophysiological, pharmacological and immunocytochemical techniques in combination with behavioral measurements, I am investigating mechanisms of aminergic modulation in identified neurons of defined networks in insects and crustacea. To address both mechanistic and functional questions, a parallel approach has been developed, which allows to investigate single identified neurons both in-vivo with intact synaptic connections and in-vitro in primary “identified” cell culture, where neurons are separated from connections to other neurons. The functional meaning of aminergic modulation on the cellular level in behaviorally-relevant circuits is assessed by quantitative behavioral measurements. The investigations show that OA enhances the responsiveness of a neuronal network in insects (“giant fiber pathway”) which triggers a fast escape reaction. The reaction to sensory stimuli in the postsynaptic giant interneurons, which are monosynaptically coupled to sensory neurons via excitatory cholinergic synapses, is significantly enhanced by OA application. Characteristic changes of the action potentials in-vivo (“spike broadening”) and patch-clamp recordings in-vitro suggest, that OA selectively affects slow K+-conductances in postsynaptic giant interneurons

Major Research Interests

The majority of cells in the human brain are glial cells, outranging the number of neurons by a factor of 10. However, most behavioral aspects of life are attributed to neurons, leaving a rather white spot of knowledge about the function of the different types of glial cells. Our group aims to identify and clarify the mechanisms that allow glial cells, e.g. astrocytes to modulate and stabilize the most vital behavior of breathing.

Major Research Interests

Our group is interested in the mechanisms of membrane fusion, with the main emphasis on regulated exocytosis in neurons. Intracellular membrane fusion events are mediated by a set of conserved membrane proteins, termed SNAREs. For fusion to occur, complementary sets of SNAREs need to be present on both of the fusing membranes, which then assemble in a zipper-like fashion to initiate membrane merger. The neuronal SNAREs are among the best characterized. They are the targets of the toxins responsible for botulism and tetanus, and they are regulated by several additional proteins including synaptotagmin, the calcium sensor for neurotransmitter release. To understand how these proteins mediate fusion, we study their properties in vitro with biochemical and biophysical approaches using native and artificial membranes.

In a second set of projects, we use modern techniques such as quantitative proteomics to better understand supramolecular protein complexes involved in synaptic function. Using our quantitative description of synaptic vesicles as point of departure we aim at unraveling presynaptic protein networks involved in synaptic vesicle docking and fusion. Furthermore, we are studying regulation of presynaptic function by small GTPases and by protein phosphorylation.

Major Research Interests

The proper function of the GnRH pulse generator ist essential for reproduction of all mammals studied so far. GnRH pulses are a prerequisite for proper pituitary gonadotropin release. The neurochemical mechanisms leading to pulsatile GnRH release involve norepinephrine and gamma amino butyric acid (GABA) as most important neurotransmitters. In addition, other catecholamines, amino acid neurotransmitters and neuropeptides play a modulatory role in the function of the GnRH pulse generator. Many of the GABAergic neurons in the hypothalamus are estrogen-receptive. The mechanisms by which the estrogen receptors of the alpha and beta subtype regulate gene and protein expression of neurotransmitter-producing enzymes are at present a prime focus of interest. Induction of puberty is not a gonadal but a hypothalamic maturational process. The initiation of proper GnRH pulse generator function is the ultimate trigger signal for puberty which is currently investigated. Ageing involves also neuroendocrine mechanisms. The GnRH pulse generator function deteriorates in aged rats, mechanisms which involve a variety of catecholamines and amino acid neurotransmitters which are currently investigated. Steroidal feedback signals (of estradiol, progesterone, and glucocorticoids) are crucial for the development and proper function of the adult hypothalamus of which the molecular and neurochemical mechanisms are studied with cell biological and animal experimental tools. Proper function of the GnRH pulse generator is also of crucial importance for initiation of puberty and maintenance of normal menstrual cycles in women. Many of hitherto unexplained infertilities can be explained of malfunctioning GnRH pulse generators which are studied in a series of clinical experiments.

Siegrid Löwel

Professor of Systems Neuroscience

- Prof. of Systems Neuroscience, BFNT and Johann-Friedrich-Blumenbach Institute for Zoology and Anthropology, Georg-August-Universität Göttingen, since 2010
- Professor of Neurobiology, Friedrich-Schiller-Universität Jena, 2005 – 2010
- Scholarship in the Hertie-Excellency Program “Neurosciences” (www.ghst.de), 2004 - 2005
- Associate Research Physiologist/Research Associate Professor, School of Medicine, Dept. Physiology, University of California in San Francisco, USA, 2002 – 2003
- Research Assistant, Dept. Neurophysiology (Prof. Dr. Wolf Singer), Max-Planck-Institut für Hirnforschung, Frankfurt am Main, 1990 – 1997
- Dr. phil. nat. (Ph.D.), 1988, Johann-Wolfgang-Goethe-Universität Frankfurt am Main

Major Research Interests

The Löwel lab is focussed on understanding the development and plasticity of neuronal circuits in the mammalian cortex. We use a combination of techniques, including optical imaging, electrophysiology and neuroanatomy to explore how experience and learning influence the structure and function of nerve cell networks and how activity patterns and genetic factors influence these processes. We hope that answering these key questions not only helps to understand the rules underlying brain development, functioning and learning but additionally will open up new avenues to develop clinically relevant concepts to promote regeneration and rehabilitation for diseased and injured brains.

The Löwel lab has made major contributions to experience-dependent changes in nerve cell networks: We were the first to demonstrate that the learning rule for the development of long-range cortical circuits is correlated activity. “neurons wire together if they fire together” (Löwel & Singer, 1992, Science 255: 209-212). We also provided evidence that these connections play a major role for context dependent effects in visual perception (Crook et al., 2002, Exp. BrainRes. 143: 295-302; Schmidt et al., 1997, Europ. J. Neurosci. 5: 1083-1089).

We were also the first to demonstrate a major effect of genetic factors on the layout of cortical maps (Kaschube et al., 2002, J. Neurosci. 22: 7206-7217) and provided evidence that long-range connections between neurons coordinate the development of different brain regions and even of the two brain hemispheres (Kaschube et al., 2009, PNAS 106: 17205-17210). Recently, we helped to establish optical imaging of intrinsic signals as a screening tool for cortical plasticity in mice (Cang et al., 2005, Vis. Neurosci. 685-691) and started characterizing various mutant mice (e.g. Goetze et al., 2010, Thygarajan et al., 2010).

Major Research Interests

Adequate control of body motion and posture depends on elaborate circuitries that connect both motor and sensory neurons with the musculature. The central importance of these connections is illustrated by the debilitating consequences of diseases affecting motor neurons, such as Amyotrophic Lateral Sclerosis (ALS) and diabetic neuropathy. Our research aims at understanding the molecular mechanisms driving the assembly of functional neuromuscular circuitries during embryonic and postnatal development. This includes the study of cell surface-based signaling molecules that control motor and sensory axon connectivity in mice. Another research focus of the lab aims at identifying and characterizing novel mechanisms driving the functional specification of motor neurons within the context of operative neuromuscular circuitry. We extensively take advantage of mouse genetics in order to selectively trace and manipulate specific neuron populations. We combine this genetic approach with live 3D fluorescence (spinning disk) microscopy, as well as electrophysiological methods to elucidate the role of cell surface and nuclear receptor proteins in sensory-motor connectivity and functional neuron specification.

Major Research Interests

The laboratory investigates fundamental aspects of synaptic vesicle recycling that have relevance to neurological and neurodegenerative diseases, using mouse and mammalian cells as a model system. A cutting edge genomic engineering is combined with the latest techniques of imaging and cell biology to study the processes that regulate synaptic vesicle formation. In a distinct but related strand of work, we are exploring the signaling processes that originate from altered neurotransmission and lead to neurodegeneration.

Major Research Interests
Our work focuses on the molecular physiology and pathophysiology of sound encoding at the hair cell ribbon synapse and its restoration. We have physiologically and morphologically characterized synapses of wild-type and mutant mice with defects in hair cell synaptic coding from the molecular to the systems level. This way we have contributed to the understanding of structure and function of the hair cell ribbon synapse and co-initiated the concept of auditory synaptopathy. Molecular dissection and detailed physiological characterization of ribbon synapse function employ a spectrum of molecular, biophysical, physiological, psychophysical and clinical approaches. Towards restoration of hearing we pursue the optogenetic stimulation of cochlea and gene replacement therapy.

Major Research Interests

We are interested in the mechanisms of neuron-glia interactions in the higher nervous system, and in the genes that are required for normal glial cell function. Here, transgenic and mutant mice have become important to study developmental processes as well as genetic diseases. For example, oligodendrocytes are glial cells highly specialized for enwrapping CNS axons with multiple layers of membranes, known to provide electrical insulation for rapid impulse propagation. We found that oligodendrocytes are also essential for maintaining the long-term integrity of myelinated axons, independent of the myelin function itself. The mechanisms by which oligodendrocytes support long-term axonal survival are still under investigation. The importance of glial cells as the “first line of neuroprotection”, however, is illustrated by several myelin-associated diseases in which axonal neurodegeneration contributes to progressive disability. These range in humans from peripheral neuropathies (CMT1) to spastic paraplegia (SPG2), and presumably multiple sclerosis (MS) and certain forms of psychiatric disorders. We are developing transgenic animal models for some of these diseases, in order to dissect the underlying disease mechanisms and, in the case of CMT1A, have used these models to design novel therapeutic strategies.

The glial “decision” to myelinate an axonal segment is partly controlled by the axon itself, but the signaling mechanism is not understood. We have found that axonal neuregulin-1 (NRG1) is the major determinant of myelination in the peripheral nervous system. We are now investigating NRG1 dysregulation also in CNS myelination, using quantifiable behavioural functions in mice. By combining genetics with environmental risk factors for schizophrenia (in collaboration with H. Ehrenreich) we will explore the hypothesis that NRG1, a known human schizophrenia susceptibility gene, points to an important role of myelinating glia in some psychiatric disorders.

Major Research Interests

Our research interest focuses on the role of ion channels in the initiation and progression of tumors. For this, we take advantage of the knowledge of the physiology and molecular biology of channels and use electrophysiological techniques along with advanced microscopy, protein engineering and animal models. Most of our work has been on a particular potassium channel frequently expressed (75%) in human tumors. We try to take advantage of the particular features of ion channels (for example, their surface expression) to design novel diagnostic and therapeutic procedures.

We also try to understand the mechanisms underlying the role of ion channels in tumors, regarding both permeation properties as well as non-canonical functions.

- Habilitation (Neurology and Clinical Neurophysiology) in Munich
- Prof. and Head of the Department of Clinical Neurophysiology 1992

Major Research Interests

We intend to understand and modulate cortical plasticity in man. This is mainly done on a behavioural, imaging and electrophysiological level. We use (motor) learning paradigms, evaluate them by behavioural techniques and by recording EMG; EEG or fMRI data in the context with connectivity analyses. We develop and/or apply stimulation techniques such as repetitive transcranial magnetic stimulation (rTMS), transcranial direct current stimulation, alternating current stimulation or random noise stimulation (tDCS, tACS, tRNS). TMS induces a short electric current in the human brain. Both rTMS and electric stimulation techniques offer the prospect of inducing LTD and LTP like effects in the human brain. Diseases in our focus are Parkinson’s disease, epilepsy, migraine, stroke and dystonia. The Department of Clinical Neurophysiology pursues other research areas such as Neurorehabilitation in conjunction with the Bernstein Centre of Computational Neuroscience and with the Company Otto Bock. Another focus concerns Hereditary Neuropathies in collaboration with the MPI for Experimental Medicine, speech disorders with a focus on stuttering and others (overview researcher ID A-3544-2009).

- 2000 – 2004 Research assistant with William Betz at the Dep. of Physiology and Biophysics, University of Colorado Health Sciences Center (USA)
- 08/2004 PhD degree (Physiology) awarded by the University of Colorado
- 2004 – 2007 Post doctoral fellow with Reinhard Jahn at the Neurobiology, Department of the Max Planck Institute for Biophysical Chemistry in Göttingen (Germany)
- since 2007 Group Leader (STED Microscopy) at the European Neuroscience Institute Göttingen (ENI-G)

Major Research Interests

Conventional fluorescence microscopy is limited by the diffraction of light: fluorescent objects that are close together cannot be discerned. Stimulated emission depletion (STED) is a recent advancement in optical physics that breaks the diffraction barrier, allowing microscopes to obtain much clearer images. The diffraction barrier has been particularly problematic for imaging synaptic vesicles, which are among the smallest known organelles (30-50 nm in diameter). They are located in small areas in the synapses (about 1 micron in diameter). The group takes advantage of the increased imaging resolution provided by STED to investigate synaptic vesicle function, with an emphasis on synaptic vesicle recycling. Since STED microscopy also allows imaging of protein domains, the group aims at studying the patterning of protein domains in the synapse, in order to understand its molecular architecture.

- 2013 Professor Molecular and Behavioral Neurobiology, Dep. of Psychiatry, LMU Munich

Major Research Interests

Our research interest is directed towards the generation and analysis of transgenic mouse mutants in order to understand individual gene functions in the adult brain. Towards this goal, we employ mouse genetics, molecular/biochemical and behavioral techniques. Our current interest focuses on basic-helix-loop-helix (bHLH) transcription factors. Several loss- and gain-of-function mouse mutants of the bHLH family that we and others have analyzed display behavioral alterations frequently also observed in psychiatric diseases. Among these are alterations of the sleep-wake or circadian behavior, altered cognitive performances and disturbed environmental adaptations to time shifts (jet-lag) or social stress. At the molecular level, we find several signaling pathways to be deregulated that likely provide a mechanistic link between disturbed environmental adaptations and deregulated gene expression seen in bHLH mouse mutants. To study cellular signaling upstream of gene expression, we have developed a series of genetically encoded biosensors that can be analyzed with standard fluorescent or luminescent reporter proteins but also with libraries of molecular barcodes to perform systems-level analyses. Currently, we aim at combining mouse models and genetic sensors to better understand the molecular adaptations of gene-environment interactions relevant for psychiatric and neurological diseases.

- 1985 Dr. rer.nat., University of Göttingen
- 1987 Dr. med., University of Göttingen
- 1997 Appointed head of the Department of Molecular Neurophysiology in the Center of Physiology and Pathophysiology, Medical School, University of Göttingen

Major Research Interests

We are trying to understand how the sense of smell works. Olfactory systems are able to detect and distinguish thousands of molecules in our environment. Receptor neurons are endowed with hundreds of different receptor molecules to bind odorants and transduce the chemical signals into electrical ones. Chemosensory information is thus represented in a rather high-dimensional space. The receptor neurons, which code the hitting probability of odor molecules binding to their molecular receptors, eventually generate trains of action potentials, a one-dimensional vector of stochastic processes. They convey their information onto the brain, in particular the olfactory bulb, where the receptor neuron signals are transformed into a two-dimensional neuronal image of firing activities. Glomerula, small skeins of receptor nerve fibers and synapses in the olfactory bulb, appear to be the heart of olfactory coding.

Using a combination of electrophysiological techniques, single molecule detection, photochemical and high resolution imaging techniques as well as computational and modeling methods, we are studying the biophysical and physico-chemical details of
- the primary coding processes,
- the synaptic transmission in glomerula
- the generation of the neuronal chemotopic map as well as
- the processes and mechanism of odor learning and memory.

- 2002 – 2006 Postdoc with Robert C. Malenka at Stanford University Medical Center (USA)
- Independent group leader (Emmy-Noether/DFG) at the European Neuroscience Institute Göttingen (ENI-G), since 2006

Major Research Interests

Activity-dependent modulations of synaptic transmission are important mechanisms of information processing and storage in neuronal circuits. A variety of related but mechanistically distinct forms of synaptic plasticity have been described in vitro preparations of brain slices.

A major goal of my laboratory is to elucidate the underlying molecular events, leading to and regulating changes in synaptic efficacy. Newly developed techniques of molecular replacement, using mouse genetics and/or viral-mediated gene transfer allow us to manipulate the molecular composition of single neurons in a spatial and temporal controlled manner.

In particular, we are able to investigate the effects of heterologously expressed proteins on the background of wild-type neurons, or neurons, in which the endogenous protein expression is diminished. We combine this technique with simultaneous dual whole cell patch clamp recordings from rodent brain slices to monitor changes in synaptic efficacy in the manipulated cell in comparison to the neighboring control cell.

Knowledge gained from the understanding of molecular mechanisms of synaptic transmission and plasticity will ultimately provide important clues for the function of neuronal circuits and potentially the functioning of the brain.

- 1997 – 2002: Diploma, Biology, University of Wuerzburg, Germany

Major Research Interests

The perception of and appropriate reaction to external and internal stimuli is critical for survival. In vertebrates, chemical, mechanical (from pleasant touch to painful contact) and thermal stimuli are detected by specialized somatic sensory neurons which transfer these signals via the spinal cord to the brain. An important subset of these neurons, so-called nociceptors, senses noxious stimuli. Consequently, their activation mediates nociception and leads to the sensation of pain.

Pain is the single most common symptom for which patients seek medical assistance. While acute pain has served as a protective mechanism throughout evolution to guard the body against injury, pain can also become chronic and highly debilitating. Unfortunately, chronic pain imposes substantial challenges to medical practice: current therapies can be effective for short-term treatment however many do not provide sufficient relief to chronic conditions or cause strong side-effects. Therefore, a deeper understanding of the molecular mechanisms underlying both, acute and chronic pain is crucially needed.

Our research focuses on the comparative and quantitative analysis of somatosensory signaling networks in established mouse models of acute and chronic pain. To this purpose our lab employs interactomics, genetic profiling, calcium-imaging, electrophysiology, neuronal tracing and mouse behavioral studies in order to address key questions:

- What are the specific dynamic changes that occur at the molecular, cellular and network levels in nociceptors during acute and chronic pain?
- How are these changes mirrored in pain-related regions of the central nervous system?

Major Research Interests

We pursue a basic research interest in glia cell biology, axon-glia interaction and mechanisms of diseases of the peripheral nervous system (PNS). We have generated a transgenic rat model of the most frequent human neuropathy, Charcot-Marie-Tooth disease type 1A (CMT1A). This disease is associated with a partial duplication of chromosome 17 which leads to an overexpression of the tetraspan protein PMP22. Transgenic “CMT rats” expressing additional copies of this gene share characteristic clinical features of the human disease, including muscle weakness, reduced nerve conduction velocities, and marked Schwann cell hypertrophy resulting in onion bulb formation. The CMT rat allows a better understanding of the cellular disease mechanism operating in human CMT1A, and is helpful in the analysis of modifier genes, epigenetic factors, and in the evaluation of experimental treatment strategies. In an attempt to translate findings from the animal model to humans we have recently identified biomarkers of disease severity in CMT1A patients. We are currently validating markers in patients from across Europe which should help us to perform clinical trials in the near future.

Major Research Interests

Mechanisms of myelin biogenesis and repair

The myelin sheath is one of the most abundant membrane structures in the vertebrate nervous system. It is formed by the spiral wrapping of glial plasma membrane extensions around the axons, followed by the extrusion of cytoplasm and the compaction of the stacked membrane bilayers. These tightly packed membrane stacks provide electrical insulation around the axons and maximize their conduction velocity. Axonal insulation by myelin not only facilitates rapid nerve conduction but also regulates axonal transport and protects against axonal degeneration. Damage to the myelin sheath, as it for example occurs in multiple sclerosis (MS) results therefore in severe neurological disability also as a result of neurodegeneration.

Our main goal is to come up with new approaches of how to promote remyelination in demyelinating diseases such as MS. To realize this goal we need to understand how myelin is formed during normal development.

Major Research Interests

Growing evidence implicates intrinsic mechanisms such as the ubiquitin proteasome systems (UPS) in brain development and disease. Our focus lies on the role of the UPS in axon growth and regeneration. We are particularly interested how E3 ubiquitin ligases regulate these processes. To further enhance our understanding of the UPS in the central nervous system, we are also seeking to identify novel brain-specific E3 ligases and to determine their role in various aspects of neuronal development.

To address these research objectives, we apply molecular and cell biological and biochemical techniques. We also use mouse models to gain comprehensive insight into the ligases of interest and to complement in vitro studies with meaningful in vivo experiments.

Major Research Interests

Composed of six cellular layers, the mammalian neocortex is a modular structure with many functional areas in which the neurons have specific morphology, number, connections and unique physiological properties. Our group is interested in understanding the molecular and cellular mechanisms involved in specification of the immense diversity of the cortical neurons in order to be generated in a correct time, number and place during development. We have recently identified sets of genes with a differential expression between distinct domains and layers of the embryonic mouse cortex. To study the function of selected candidates in the transcriptional control of neurogenesis, we combine approaches for targeted gene inactivation or gene activation in transgenic mice using the conventional and conditional knock-out strategies with biochemical, morphological, gene expression, tissue culture methods and techniques for gene transfer in isolated brain or living mouse embryos.

With one gene, the transcription factor Pax6, we are further ahead in understanding its function. Pax6 is a critical gene for neocortical development, endowing the pluripotent radial glial progenitors with neurogenic ability and controlling the cortical patterning, including layer and area formation. Our current research focuses in unraveling genetic mechanisms by which Pax6 regulates these developmental processes with a special emphasis on its role in the control of neuronal subtype identity. We address these questions by studying the function of genes recently identified by us to act as Pax6 targets or Pax6 protein partners controlling its neurogenic function. We further aim to get insight into Pax6 dependent mechanisms involved in generation of stem/progenitors cells and their regenerative properties in neurogenic zones of the adult brain.

Walter Stühmer

Professor, Director at the Max Planck Institute for Experimental Medicine

- 1978 – 1980 PhD with Dr. F. Conti in Camogli, Italy
- 1980 – 1983 Post Doc in the Department of Physiology and Biophysics in Seattle, USA, with Dr. W. Almers
- 1983 – 1992 group leader at the Max Planck Institute for Biophysical Chemistry in Göttingen with Dr. E. Neher
- 1992 – present Director of the Department Molecular Biology of Neuronal Signals at the Max Planck Institute for Experimental Medicine in Göttingen

Major Research Interests

The principal aim of the department “Molecular Biology of Neuronal Signals” is the study of signaling within cells and between cells. To this end, molecular biology, genetics and electrophysiology are used to elucidate structure-function relationships of membrane-bound proteins, especially ion channels and receptors. Specific tools such as antibodies and toxins are developed and used to interfere with signaling pathways relevant for cell cycle control, ion selectivity and the secretion of cells in culture and in primary cells.

Professor, Director of the German Primate Center

- Head of the Cognitive Neuroscience Laboratory
- Ph.D. 1992, Massachusetts Institute of Technology
- Postdoctoral Fellow, MIT, 1992 – 1993
- Postdoctoral Fellow, Baylor College of Medicine, Houston, Texas, 1993 – 1995
- Work Group Leader, Laboratory of Cognitive Neuroscience, University of Tübingen, 1995 – 2001
- Professor of Animal Physiology, University of Tübingen, 2000 – 2001
- Professor of Cognitive Neuroscience and Biological Psychology, University of Göttingen, 2001

Major Research Interests

Research at the Cognitive Neuroscience Laboratory is aimed at understanding the neural basis of visual perception. Vision is an active process that is far more than a passive registration of our environment. Rather, on its way from the eyes to and through the cortex, visual information is modulated by numerous processes that enhance some aspects while diminishing others. One of these processes is attention, i.e. the ability to filter out unwanted information and concentrate the brain’s processing abilities on relevant information.

The accurate representation of visual motion in the environment is one of the most important tasks of the visual system. Correspondingly, research in the laboratory concentrates on this ability as a model for sensory information processing in general.

We use various techniques. While our emphasis is on electrophysiology, i.e. the recording of the activity of neurons in the visual cortex of macaque monkeys and measuring human perceptual abilities with psychophysical methods, we also use theoretical approaches and functional brain imaging.

Using these techniques, we have been able to elucidate how motion information is represented in primate cortical area MT and how attention changes that representation and correspondingly the percept of the visual environment.

Andreas Wodarz

Professor of Stem Cell Biology

- Diploma Biology, University of Cologne, 1990
- Dr. rer. nat. Developmental Biology, University of Cologne, 1993
- Postdoc, Howard Hughes Medical Institute, Stanford University, 1994 – 1997
- Junior Group Leader, Heinrich Heine University Düsseldorf, 1997 – 2004
- Habilitation in Genetics, Heinrich Heine University Düsseldorf, 2001
- Appointed as Head of the Department of Stem Cell Biology at the University of Göttingen, 2004
- Appointed as Head of the Department of Anatomy and Cell Biology at the University of Göttingen, 2010

Major Research Interests

The research activities in the Wodarz laboratory focus mainly on different aspects of the asymmetric division of neural stem cells. Asymmetric cell division is a fundamental mechanism for the generation of cell diversity in complex organisms. At the same time, asymmetric cell division is essential for the balance between stem cells and differentiating cells in an organism. Disturbances of this balance can cause severe diseases, including cancer and neurodevelopmental disorders. Asymmetric cell division is intricately linked to the control of apical-basal cell polarity, which is investigated in a second research focus. The establishment and maintenance of apical-basal cell polarity is connected to the regulation of planar cell polarity (PCP) and cell adhesion, especially in epithelial tissues. In this context, we investigate the function of the evolutionarily conserved Wnt signal transduction pathway in the regulation of PCP and cell adhesion.

The model organism of our research is mainly the fruit fly *Drosophila melanogaster*, as it is easily accessible to genetic manipulation and is very well suited for cell biological analyses using high-resolution light microscopy.

Major Research Interests

- Theoretical neuroscience and nonlinear dynamics
- Dynamics and synchronization in cortical neural networks
- Function and development of the visual cortex
- Sensory processing in the auditory system

The brains of humans and animals arguably are among the most complex systems in nature. Over the past decade, theoretical neuroscience - the use of quantitative theories, mathematical modelling and advanced quantitative data analysis methods for the study of brain function - has started to provide powerful new approaches for understanding the neuronal basis of perception, learning, memory, and other higher brain functions. This is because, even during the neuronal processing of the most elementary sensory stimulus large ensembles of interacting nerve cells distributed throughout the brain are activated, the collective operations of which are often hard to understand by means of purely qualitative reasoning.

The primary focus of our research in theoretical neuroscience is self-organization in the dynamics of cortical networks. In particular, we have developed novel approaches to model and predict the dynamics and neuronal plasticity of the visual cortex. To quantitatively connect theory and experiment in this system, we recently also designed methods that enable to quantify the organization of visual cortical functional architecture with high precision. Another important focus of our work is the mathematical analysis of the dynamics of large and complex networks of pulse-coupled neuron models. The concepts and tools for the representation of the dynamics of cortical circuits developed enable a rational and transparent design of models of higher cortical functions such as the processes underlying perceptual learning phenomena.

**Major Research Interests**

The focus of our research is the regulation and role of the neuronal cytoskeleton in the modulation of neuronal shape and motility during chemotactic processes. The growing neuronal growth cone probes its environment for the chemical composition of its substrate and the presence of neighbouring cells. The former information is sampled by cell adhesion receptors in focal adhesion structures that, next to their sensing function also perform a structural function in that they provide the cell with a means to exert force on its substrate. We are primarily interested in the signal transduction processes that regulate these effects and the cross-talk between the different motility systems.

The main interest areas in this question are: 1. The role and molecular mechanism of lipid raft-resident cell adhesion molecules in the remodelling of the membrane cytoskeleton, 2. Dynamic control of growth cone protein content by local proteolysis and chaperone function during chemotactic responses, 3. Role and mechanism of the neuronal exocyst complex as critical landmarks for dendritic/axonal neuritogenesis.

Our group has a related interest in the pathophysiological mechanism of neurodegeneration by intracellular aggregation of the tau protein, as occurs in Alzheimer's disease. As tau is an intrinsically unstructured protein that can undergo remarkable conformational changes upon binding to microtubules and in the Alzheimer-related aggregation condition, it presents an ideal model system for the biophysical analysis of protein conformational change and protein interactions.

Our research depends on the development and application of advanced microscopy techniques, primarily; fluorescence lifetime imaging microscopy (FLIM), and Förster resonance energy transfer (FRET) microscopy, in combination with a range of GFP-based optical biosensors and novel bioconjugation approaches for organic dyes, and protein biochemical/molecular biological techniques to resolve and quantify biochemical reactions and conditions in living cells.
