Letter from the President

The University of Göttingen is committed to the education of the next-generation scientists. Firmly rooted in excellent science, our goals are to train competent and critical young academics that are able to meet the challenges of the future. Within the Göttingen Campus, the cooperation between our university, the local Max-Planck Institutes and the German Primate Center fosters a dynamic and vibrant research environment in which the free exchange of ideas leads to top science in a true manifestation of the famous “Göttingen Spirit”.

The two international MSc/PhD programs in Neurosciences and Molecular Biology are highly acclaimed role models in graduate training that 20 years after their foundation continue to be enormously successful. Embedded in the Göttingen Campus they integrate faculty members across institutional borders and provide junior faculty members with full rights as thesis supervisors. The programs offer not only scientific training of outstanding quality but also a comprehensive range of services including training in professional skills, career counseling, and practical support for dealing with daily life, greatly facilitating integration of students from abroad. Due to their success, these programs served as blueprints for the creation of additional PhD training programs that are united under the roof of the Göttingen Graduate Center for Neurosciences, Biophysics and Molecular Biosciences (GGNB). GGNB was supported by the Federal Excellence Initiative until the expiration of its Graduate School program and is now stably financed by the university in cooperation with its partners on the Göttingen Campus.

The Neuroscience and Molecular Biology programs remain unique within the GGNB in offering integrated MSc/PhD curricula with a fast track option, which allow excellent BSc graduates to directly enter the PhD phase after successfully absolving the initial 1st year training phase. For two decades, these international programs have been particularly successful in attracting large numbers of high quality applicants from all around the world, allowing for the selection of the very best candidates. The new concepts that were introduced by these programs have recently been adopted by the Georg-August University School of Science (GAUSS) and other graduate schools for the benefit of the entire University.

While maintaining their successful structure, the content and focus of the training curriculum of the programs has continuously been adapted to keep pace with the dynamic change of research areas in the participating institutions. Accordingly, new faculty members are integrated to reflect novel developments in research. They will further ensure optimal individual supervision and up-to-date research-oriented training. Beyond academia, both programs maintain close links with the relevant industries to enhance the opportunities of the graduates for a successful professional career in the private sector.

As founding member and former speaker of the international MSc/PhD program in Molecular Biology I am very proud of what we all have achieved, and I remain on board as an active faculty member despite the many obligations in my new office. Most importantly, I would like to thank all colleagues and institutions for their unwavering commitment to these international programs and, last but not least, the German Academic Exchange Service (DAAD), the Lower Saxony Ministry of Science and Culture, and the various generous donors. The University of Göttingen will continue to support these programs to promote international exchange at all levels and for further interaction with our partners worldwide.

Prof. Dr. Reinhard Jahn

(President of the University of Göttingen)
Letter from the Max Planck Society

The mission of the Max Planck Society is to conduct top-level basic research in science and the humanities. Because this is only possible with bright young minds, the Max Planck Society funds graduate education nationwide - including the Neuroscience program in Göttingen.

Currently, over 80 Max Planck Institutes are located on scientific campuses across Germany, most of them close to universities. To strengthen the scientific ties with universities, the Max Planck Society, together with the German University Rectors’ Conference, launched the International Max Planck Research Schools (IMPRSs) as a new joint program - during celebrations in Göttingen on the occasion of the 50th anniversary of the Max Planck Society.

The goals of the IMPRSs are

- to attract excellent students from all around the world to intensive PhD training programs in Germany, preparing them for careers in science,
- to integrate internationally renowned Max Planck researchers into top-level scientific training programs for junior scientists, and
- to strengthen international relationships by providing individual support to each student and by exposing foreign students to German culture and the German language.

By now, 64 International Max Planck Research Schools have been established involving 81 Max Planck Institutes, 35 German universities, and 26 universities abroad. Over 3,100 PhD students from over 123 countries are presently enrolled.

Since their foundation in 2000, the Göttingen IMPRSs in Neurosciences and Molecular Biology have met with particular - and extraordinary - success. This is due to multiple factors. Most notably, the Göttingen IMPRSs in Neurosciences and Molecular Biology are the result of a true synergism between the local Max Planck Institutes and the University of Göttingen, the University Medical Center Göttingen, the German Primate Center, and additional extra-university institutions, which allowed to completely reform local graduate education in the course of their establishment. Moreover, all of the respective IMPRS funds are invested into the Neurosciences and Molecular Biology graduate programs. This allows us to offer excellent training conditions and financial support, which is a major attraction for the best students worldwide. Accordingly, most former students of our programs moved on to postdoctoral positions, typically at prestigious international institutions, and many have become successful independent scientists themselves.

Over the past two decades, the IMPRS-funded graduate programs in Neurosciences and Molecular Biology have received unanimous acclaim during external evaluations and won national awards. For instance, they are the only Life Science Programs within Germany that were selected for the „Top Ten International Master’s Degree Courses 2006“. The Schools have also re-shaped the local scientific community, strengthening the ties between the participating institutions, and initiated new scientific collaborations that augment the international reputation of Göttingen as a centre of scientific excellence. Furthermore, the schools served as role models and founding members of the Göttingen Graduate Center for Neurosciences, Biophysics, and Molecular Biosciences, thus being instrumental for the continued support by the German Excellence Initiative provided to the University. We hope that in the years to come our IMPRS students will continue to be successful in their professional careers - and that they will remember their training period in Göttingen as an exciting, stimulating, and formative phase of their lives.

Nils Brose
Dean of the IMPRS
Neurosciences
Overview

This yearbook is intended to provide information on the International MSc/PhD/MD-PhD Program for Neurosciences in Göttingen, Germany, which was established in 2000. In addition to general information on the program, the yearbook introduces the current year’s students, the faculty members, the program committee, and the coordination team.

The program is a member of the Göttingen Graduate Center for Neurosciences, Biophysics, and Molecular Biosciences (GGNB), which was supported by the Federal Excellence Initiative until the expiration of its Graduate School program and is now stably financed by the university in cooperation with its partners on the Göttingen Campus. It is offered by the University of Göttingen, the Max Planck Institute for Biophysical Chemistry (MPIbpc), the Max Planck Institute for Experimental Medicine (MPIem), the Max Planck Institute for Dynamics and Self-Organization (MPIds), the German Primate Center (DPZ), and the European Neuroscience Institute (ENI). Further to their active participation in the Neuroscience Program, the above mentioned partners closely cooperate in the current and former Clusters of Excellence (CNMPB 2002-2019 and MBExC since 2019), the Göttingen Center for Molecular Biosciences (GZMB), the Center for Systems Neuroscience (ZNV), in several collaborative research centers (Sonderforschungsbereiche, SFB), and in interdisciplinary doctoral programs (Graduiertenkollegs, GRK).

The International MSc/PhD/MD-PhD Neuroscience Program qualifies students for professional work in the neurosciences. The program is open to students from Germany and from abroad, who hold a Bachelor’s degree (or equivalent) in the biosciences, medicine, psychology, physics, or related fields. All courses are held in English. Scholarships are available. The academic year starts in October and is preceded by a three week orientation program. Applications may be submitted until January 15 of the year of enrollment. To ensure a high standard of individual training, the number of participants is limited to 20 students per year.

All students initially participate in one year of intensive course work. This first segment of the program comprises lectures, tutorials, seminars, methods courses, and independent, individually supervised research projects (laboratory rotations). The traditional German structure of academic semesters is not followed. The condensed schedule allows students to accumulate 90 credits (ECTS) within one year, which would normally require three semesters.

Subsequently, two separate segments are offered:

- **PhD Program**: Good to excellent results after the first year qualify for direct admission to a three-year doctoral project in one of the participating research groups. The Master’s thesis requirement is waived in this case. After successful defense of a doctoral thesis, the degree Doctor of Philosophy (Ph.D.) or the equivalent title Doctor rerum naturalium (Dr. rer. nat.) is conferred. Students who finished medical school can apply for an MD-Ph.D. title.

- **MSc Program**: Alternatively, students may conclude the program with a Master’s thesis, based on six months of experimental scientific research. The degree Master of Science (M.Sc.) is awarded upon successful completion of the Master’s thesis. The continuation in the PhD program is possible and desired.
**Intensive Course Program (First Year)**

Throughout the first year, current topics in the neurosciences are covered by
- lectures
- tutorials
- methods courses
- laboratory rotations
- seminars
- skills courses

**Lectures and Tutorials (Theoretical Modules)**

A comprehensive lecture series is organized into a sequence of 4-6 week units. The following topics are taught on an advanced level throughout the first year (36 weeks, 4 hours per week):

A. (M.Neuro.11, M.Neuro.16): Neuroanatomy and Development

C. (M.Neuro.12): Physiology

D. (M.Neuro.13): Modelling, Autonomous Nervous System, Pharmacology

E. (M.Neuro.15): Sensory and Motor Systems

F. (M.Neuro.16): Clinical Neurosciences and Higher Brain Functions

G. Specialization Seminars and Tutorials

Each lecture is accompanied by a tutorial session, where students meet with a tutor in small groups. Tutorials involve exercises, review of lecture material, and discussion of related topics.
Methods Courses (Practical Modules)

During the first months of the Neuroscience Program, students participate in a series of methods courses to introduce them to principles and practical aspects of basic scientific techniques and the handling of model organisms. The practical courses and tutorials comprise the following topics:

**M.Neuro.21 Histology & Cytology**
- comparative development of the vertebrate brain
- cytology and ultrastructure of the human brain
- functional neuroanatomy of sensory and motor systems
- immunocytochemical techniques and single neuron recording
- development and neuroanatomy of invertebrate models

**M.Neuro.22 Electrophysiology**
- introduction to medical statistics and programming languages
- electrophysiological techniques
- membrane physiology / synaptic transmission
- FLIM / Ca-imaging / FCS techniques / confocal microscopy
- sensory and behavioral physiology

**M.Neuro.23 Microscopy & Imaging**
- neuronal modelling
- behavioral analysis
- neuroendocrinology / neuropharmacology
- protein separation techniques

**M. Neuro.24 Zoo-Physiology**
- cell culture methods
- methods in molecular biology
- genetics of transgenic mouse models

Laboratory Rotations (Practical Module M.Neuro.25)

Starting in January, every student carries out three independent research projects (laboratory rotations) in participating laboratories. Each project is individually supervised and involves seven weeks of experimental work, followed by one week for data analysis and presentation. For each project, a report must be completed in the format of a scientific publication. The laboratory rotations must cover at least two different subjects.
Seminars

Seminars start in March. The class meets weekly for two hours to discuss two or three student presentations. The presentations are research reports based on work from the laboratory rotations.

Examinations

After the first year of intensive training, all students take one written and two oral Master’s examinations. The Master’s examinations explore the students’ theoretical background in topics covered by lectures and tutorials. All candidates are examined both in the field of anatomy and physiology in two separate oral exams.

PhD Program

Students who have passed the Master’s examinations with good or excellent results qualify for direct admission to a three-year doctoral project in one of the participating research groups without being required to complete a Master’s thesis first.

The PhD program emphasizes independent research by the students in the group of a faculty member. The PhD students select three independent faculty members as their thesis advisory committee who closely monitor progress and advise the students in their research project. Laboratory work is accompanied by seminars and lecture series, a wide variety of advanced methods courses, training in scientific writing and oral presentation skills, courses in intercultural communication, career planning, time and project management, bioethics and research ethics, elective courses, and participation in international conferences or workshops. Regular industry excursions are offered to biotechnological or pharmaceutical companies, including visits of the R&D facilities and discussions of career options with representatives of the HR departments.

Doctoral students of the program organize the international PhD student symposium “Neurizons” every two years with great success, attracting outstanding speakers and up to 300 participants from all over the world. The meeting was designed by the students to promote scientific exchange between young researchers from different disciplines. Since a few years, a “Career Fair for Scientists” precedes the Neurizons meetings. The career fair offers a unique and exciting program of career presentations, workshops and networking opportunities and is also organized by the Neuroscience students. Both events include an increasing number of alumni, sharing their experience.

At the end of the PhD training program, a doctoral thesis is submitted either in the traditional format, or as a collection of scientific publications in internationally recognized journals along with a general introduction and a discussion of the results. The degree Ph.D. or, alternatively, Dr. rer. nat. will be awarded after the successful defense of the doctoral thesis. Having fulfilled all PhD degree requirements, medical students may apply for the degree of an M.D.-Ph.D. at the Medical Faculty.

Master’s Program

After the first year of intensive training, students may conclude the program with a six-month thesis project, leading to a Master of Science degree. The thesis project involves experimental work under the supervision of faculty members of the Neuroscience Program. Students have the opportunity to conduct their Master’s thesis project at an affiliated research institution abroad.
Orientation, Language Courses, Social Activities

A three-week orientation prior to the program provides assistance and advice for managing day-to-day life, including arrangements for bank account, health insurance, residence permit, housing, and enrollment. Students have the opportunity to meet faculty members and visit laboratories of the participating institutions. In addition, the orientation program informs students about computing and library facilities, the city and university of Göttingen, sports facilities, and cultural events.

An intensive basic language course in German is offered in cooperation with the Lektorat Deutsch als Fremdsprache to facilitate the start in Göttingen. Additional language courses and social activities accompany the program.

Application, Selection, and Admission 2020

Applicants must hold a Bachelor’s degree or equivalent in biology, medicine, psychology, physics, chemistry, or related fields. Applicants who are not native speakers of English should demonstrate adequate competence of the English language by acceptable results in an internationally recognized test.

In the year 2020, the coordination office received 420 applications from 62 countries.

* NEURASMUS student
Yuliya Badayeva

EDUCATION

College / University: 
University of British Columbia

Highest Degree: 
B.Sc.

Major Subjects: 
Neuroscience, Developmental Biology, Genetics

Lab Experience: 
Molecular biology (cloning, in-situ hybridization, PCR, RNA and protein extraction, Western Blot, immunofluorescence and immunohistochemistry), light and fluorescence microscopy, bioinformatics (genomic data analysis, R), animal husbandry.

Projects / Research: 
2018 – 2020: Analysis of enhancer sequence activity during cerebellar development and identification of a novel regulator of granule cell differentiation and migration, Goldowitz Lab, UBC Department of Medical Genetics
2015: Characterizing of molecular markers of pulmonary arterial hypertension, Pulmonary Hypertension Research Group, University Institute of Cardiology and Respirology of Quebec
2014: Cell shape, motility, and the role of Toll-like receptor signaling during Campylobacter jejuni infection, Vallance Lab, BC Children’s Hospital Research Institute

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School
2019: UBC Genome Science and Technology Program Scholarship
2016: Natural Sciences and Engineering Research Council of Canada (NSERC) Student Research Award

Maximilian Ferle

EDUCATION

College / University: 
University of Göttingen

Highest Degree: 
B.Sc. (Honors) in Biochemistry

Major Subjects: 
Biochemistry, Biophysics, Bioinformatics

Lab Experience: 
(Fluorescence-) microscopy; transformation (CaCl₂, Electroporation) of microorganisms; mammalian cell culture, transfection (Lipofectamine); purification of synaptic vesicles from rat brain, protein extraction and purification, western blotting, automated peptide- and oligonucleotide-synthesis; DNA extraction, purification and PCR; formation of liposomes, reconstitution of membrane proteins, encapsulation of soluble proteins, HPLC, ITC, AFM, stopped-flow, photometric enzyme-kinetics, fluorimetric FRET measurements, reading of MS- and NMR-spectra; advanced programming in Python and R

Projects / Research: 
Since 2020: Bachelor’s thesis and subsequent research assistance “The role of tight junction proteins for collective cell migration” Dept. of Biophysical Chemistry (Prof. Janshoff), Institute for Physical Chemistry, Göttingen
2019: Internship “Characterization of a vesicular nucleotide transporter (VNUT)”. Dept. of Neurobiology (Prof. Jahn), MPI for Biophysical Chemistry, Göttingen

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School
Svilen Georgiev

EDUCATION

College / University:
University of Economics Varna; Freie Universität Berlin

Highest Degree:
B.Sc. Finance; B.Sc. Biology

Major Subjects:
Neurobiology, Biochemistry, Genetics

Lab Experience:

Projects / Research:
2020: Student assistant position, Rosenmund Lab, Charité, support of the TAs
2019 – 2020: Internship, Daumke Lab, MDC for Molecular Medicine, investigation of the Aryl Hydrocarbon Receptor from a biochemical perspective
2019: Internship and Bachelor’s Thesis, Kettenmann Lab, MDC for Molecular Medicine. Topic of the thesis: “Communication between neurons and microglia via metabotropic glutamate receptors”

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School

Ali Ghadami

EDUCATION

College / University:
Islamic Azad University, Tehran Medical Sciences

Highest Degree:
B.Sc.

Major Subjects:
Cellular and Molecular Biology – Genetics

Lab Experience:
Immunohistochemistry, DAB staining, Nissl staining, Stereotactic surgery, Rat perfusion, Rat and mice brain dissection, Rat IP and ICV injection, behavioral tests (rats), Real Time PCR, Primer Designing, SDS-PAGE.

Projects / Research:
2019 – 2020: “Synaptophysin alteration in Hippocampus in rats with Morphine Addiction”, Dr. Solmaz Khalifeh, Cognitive and Neuroscience Research Center (CNRC), Islamic Azad University Tehran Medical Sciences, Tehran, Iran
2016 – 2018: “Molecular Mechanisms of Cocaine Addiction and its related Behavioral Changes”, Prof. Dr. Mohammad-Reza Zarrindast, Pharmacology Department of Tehran Medical University, Tehran, Iran

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School
Sophie Gobeil

EDUCATION

College / University:
University of Calgary

Highest Degree:
B.Sc.

Major Subjects:
Neuroscience

Lab Experience:
Wet laboratory skills: Zebrafish and mouse husbandry and basic dissections, in situ hybridization, immunohistochemistry, qPCR, gel electrophoresis, microtome and cryosectioning, light and fluorescence microscopy.

Dry laboratory skills: ImageJ, MATLAB, Python.

Projects / Research:
2019: International Internship, “Outer retinal phenotype in a sema3fa mutant zebrafish model of choroidal neovascularization”, Dr. Sarah McFarlane, University of Calgary
2018: Summer Internship, “Anisotropic exclusion effect between photocatalytic Ag/AgCl Janus particles and passive beads in a dense colloidal matrix”, Dr. Larysa Baraban, Technische Universität Dresden
2017: Summer Internship, “Investigating the role of Cystatin C in astrocytes in experimental autoimmune encephalomyelitis”, Dr. Shalina Ousman, University of Calgary

Scholarships:
2020 – 2022: DAAD Study Scholarship

Vladyslav Ivanov

EDUCATION

College / University:
University of Göttingen

Highest Degree:
B.Sc.

Major Subjects:
Biology

Lab Experience:
Psychophysical experiments, MATLAB, Drift Diffusion Model, Signal Detection Theory, handling fly stocks, behavioural analysis, preparation and staining of the nervous system of D. melanogaster larvae, light and fluorescence microscopy, PCR, gel electrophoresis, FPLC.

Projects / Research:
2020: Bachelor thesis “Effector specificity in visual perceptual learning”, at the Department “Neural Circuits and Cognition”, European Neuroscience Institute, Göttingen, Germany
2019 – 2020: Internship and student research assistant “learning in non-pupate D. melanogaster larvae”, at the Department for Molecular Neurobiology of Behaviour, Schwann-Schleiden-Research Center, Göttingen, Germany
2018: Internship at the Department for Physical Biochemistry, Max-Planck-Institute for Biophysical Chemistry, Göttingen, Germany

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School
2019: Lower Saxony Scholarship
Henrike Jungeblut

EDUCATION

College / University:
Heidelberg University
Trinity College Dublin

Highest Degree:
B.Sc.

Major Subjects:
Psychology

Lab Experience:
EEG and fMRI; basic coding in MATLAB (psychtoolbox), fMRI data analysis via SPM, statistics in IBM SPSS and R.

Projects / Research:
2019 – 2020: “Long- and short-term interactions between personality, genetic and epigenetic factors, environmental conditions and mental health and well-being in children, adolescents and adults.” Student assistant position at Central Institute for Mental Health Mannheim
2019: “Neuroendocrine mechanisms of grief.” Research internship at the Institute for Medical Psychology at University Hospital Heidelberg

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School
2017 – 2020: Deutschlandstipendium
2018: Baden-Württemberg-Stipendium

Sinem Koçak

EDUCATION

College / University:
Boğaziçi University

Highest Degree:
B.Sc. (Hons.) Molecular Biology and Genetics

Major Subjects:
Molecular Biology of the Cell, Molecular Genetics, Biochemistry, Psychology and Pharmacology

Lab Experience:
Zebrafish Embryo Injection, Fruit Fly Adult Brain Dissection, Cryosection, Fluorescent Microscopy, Confocal Microscopy, Immunohistochemistry, In-situ Hybridisation, Molecular Cloning Techniques, Mammalian Cell Culture Techniques, Western Blot and Protein Assays.

Projects / Research:
2018: University of Vienna, Thomas Hummel. Antibody Screen for Asymmetric Body in Drosophila melanogaster brain
2016 – 2018: Boğaziçi University, Stefan Fuss. The neural regeneration pattern in Zebrafish upon damage and Cre-lox transgenic Zebrafish generation
2016: Boğaziçi University, Reşit Canbeyli. Behavioural experiments on the relation between learning and depression in rat
2015: Boğaziçi University, Kuyaş Buğra Bilge. The role of SIK2 in transformation of Müller Glia cells to progenitor cells and Site Directed Mutagenesis of GAB1

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School
Dafna Ljubotina

EDUCATION

College / University:
Keele University, United Kingdom

Highest Degree:
B.Sc.

Major Subjects:
Neuroscience

Lab Experience:
Immunohistochemistry - Microscopy - Pharmacological techniques - Electrophysiology.

Projects / Research:
2019 – 2020: “What are the key brain mechanisms and structures involved in supporting memory, particularly memories of fear and context and what happened when these mechanisms are dysregulated?” Dr Simon Trent, Keele University, United Kingdom
2019 – 2020: “Determining the distribution of dopamine across layers of the rat entorhinal cortex throughout post-natal development” Dr Douglas Caruana, Keele University, United Kingdom

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School

Taisiia Nazarenko

EDUCATION

College / University:
Taras Shevchenko National University of Kyiv

Highest Degree:
B.Sc.

Major Subjects:
Genetics

Lab Experience:
Agrobacterium-mediated plant transformation; molecular genetic analysis; plant breeding; cultivation, hybridization and phenotypic analysis of Drosophila melanogaster.

Projects / Research:
2019 – 2020: Bachelor’s Thesis “Agrobacterium-mediated in vitro transformation of callus induced from shoot apical meristems of common wheat cv. Podolyanka and cv. Yatran 60” Dept. of Molecular Genetics, Institute of Cell Biology and Genetic Engineering, Kyiv, Ukraine
2018 – 2020: “Molecular genetic analysis of Triticum aestivum L. at different stages of development”, Dept. of Molecular Genetics, Institute of Cell Biology and Genetic Engineering, Kyiv, Ukraine
2018 – 2020: “Investigation of inheritance of nptII transgene in bread wheat”, Dept. of Molecular Genetics, Institute of Cell Biology and Genetic Engineering, Kyiv, Ukraine

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School
2016 – 2020: Ukrainian State Scholarship for students with high academic achievements
Petr Nejedly

EDUCATION

College / University:
Brno University of Technology

Highest Degree:
Bachelor in Biomedical Technology and Bioinformatics

Major Subjects:
Signal & Image Processing, Biological signal analysis, Artificial intelligence in medicine

Lab Experience:
2017 - 2020: The Bioelectronics Neurophysiology and Engineering (BNE) Laboratory at Mayo Clinic, USA
2015 - 2020: Institute of Scientific Instruments of the CAS, Czech Republic

Projects / Research:
Localization of epileptic seizure onset zones from intracranial EEG recordings and epileptic seizure prediction. Utilization of artificial intelligence for automated processing of EEG.

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School

Jackeline Neves Pereira

EDUCATION

College / University:
Federal University of São Paulo (UNIFESP), Brazil

Highest Degree:
MBBS

Major Subjects:
Medicine

Lab Experience:
Human behavioral; fMRI; Polysomnography and EEG analysis; Matlab.

Projects / Research:
July 2019: SSSSLEEPING Project: Long-term memory performance and EEG signals night and day (Donders Institute, Sleep and Memory Group, Radboud University, The Netherlands)
2015 – 2016: Distorted entorhinal cortex grids disrupt memory (Donders Institute, Space and Memory Group, Radboud University, The Netherlands)
2013 – 2015: Memory systems behind primacy effect (Division of Psychobiology, Memory Group, UNIFESP)

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School
2017 – 2018: Undergraduate researcher scholarship by FAPESP
2015 – 2016: Science without Borders scholarship by CNPq
2013 – 2015: Undergraduate researcher scholarship by CNPq
Neha Prasanna

EDUCATION

College / University:
PES University

Highest Degree:
B.Tech. (Biotechnology)

Major Subjects:
Biostatistics, Biochemistry, Molecular Biology & Genetics, Bioinformatics, Engineering Mathematics

Lab Experience:
Molecular cloning, PCR, Gel electrophoresis, SDS PAGE, ELISA, Western Blot, C. elegans (Handling, Survival assay), Rodents (Fear Conditioning, Viral infusion, Stereotoxic surgery, Perfusion), Fluorescence microscopy, Secondary cell culture, AAV & retro-virus production, Python, Bioinformatics.

Projects / Research:
2019 – 2020: Study of structural & molecular correlates of remote memory formation & retrieval - Dr. Balaji Jayaprakash, IISc Bangalore
2018: Study of the role of neuropeptides & interleukin related molecules in C. elegans immunity – Dr. Varsha Singh, IISc Bangalore (JNCASR summer fellowship)

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School
2018: JNCASR Summer Research Fellowship Awardee
2015 – 2019: Professor C. N Rao scholarship (PES University)

Carolina Quintanilla Sánchez

EDUCATION

College / University:
Faculty of Medicine, Autonomous University of Nuevo Leon UANL

Highest Degree:
Medical Doctor

Major Subjects:
Human Medicine

Lab Experience:
Collaboration in the neurophysiological and behavioral aspect of the project entitled: “Cellular Mechanisms of segregation and consolidation of memory traces in an Alzheimer Disease rodent model” in the Laboratory of Experimental Neurophysiology at the Biomedical Center of the Faculty of Medicine in Pilsen, Charles University.

Projects / Research:
Most of my experience in research has been clinical, especially in endocrinological chronic degenerative diseases. However, in the last months I have been working more on systematic reviews of different topics, but with special focus on methodology and statistical analysis

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School
Mahalakshmi Ramadas

EDUCATION

College / University:
SASTRA Deemed University, Tamil Nadu, India

Highest Degree:
B.Tech. in Bioengineering

Major Subjects:
Biology, Electronics, Applied Science

Lab Experience:
Western and Northern blots, RT-PCR, Immunofluorescence, Confocal Microscopy, Cell Culture, Gait analysis, MATLAB and Simulink, PYTHON, Basics of Image J, Basics of SPSS, ORIGIN.

Projects / Research:
2020: Internship at Healthcare Technology Innovation Centre, Indian Institute of Technology-Madras, India, (Preejith S.P): “Explore the commercial feasibility of neurostimulation techniques in enhancing the cognitive performance of individuals” and “An algorithm for generating sleep stage annotations using bio-signals, specifically ECG”

2019: Bachelor’s Thesis: Krichenky Lab, Brigham and Women’s Hospital, Harvard Medical School, USA, (Dr. Anna Krichevsky, Dr. Rachid El Fatimy): “The role of miR-10b in the nucleus of glioblastoma cell lines”

2018: Mini Project, SASTRA Deemed University, India, (Dr. Anupama, Dr. Adalarasu): “To study the effect of music on gait and cognition”

Scholarships:
2020 - 2022: Gold Neurasmus Excellence Scholarship (NExS)
2020 - 2021: Stipend by International Max Planck Research School

Anna Siegert

EDUCATION

College / University:
University of Göttingen

Highest Degree:
B.Sc.

Major Subjects:
Molecular Medicine

Lab Experience:
FACS, Western Blot, DIC and fluorescence microscopy, confocal microscopy and FRAP, CD spectroscopy, DLS, cell culture, cryosectioning and immunohistochemistry

Analysis: FlowJo, ImageJ, Excel, GraphPad Prism.

Projects / Research:
“The impact of aging on the Vγ6+γδ T cell population in murine lymph nodes, thymus and ear skin”. Institute of Immunology, Medical school of Hanover, Prof. Dr. Immo Prinz

“α-synuclein liquid-liquid phase separation and its interplay with Alzheimer’s Disease related Tau protein”. German Center for Neurodegenerative Diseases, Göttingen, Prof. Dr. Markus Zweckstetter

Bachelor Thesis: “Influence of disease-associated post-translational modifications on Tau-organellae interactions”. German Center for Neurodegenerative Diseases, Göttingen, Prof. Dr. Markus Zweckstetter

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School
Dawn J Tan

EDUCATION

College / University:
National University of Singapore

Highest Degree:
B.Sc.

Major Subjects:
Life Sciences (with specialization in Biomedical Sciences), Psychology

Lab Experience:
Stem cell culture and differentiation, Western Blot, protein extraction, immunohistochemistry, immunofluorescence assay and imaging, light and fluorescence microscopy, ImageJ processing, statistics in IBM SPSS.

Projects / Research:
2018 – 2019: Bachelor’s Thesis “Loss of FEZ1 results in impairment of motor neuron development and morphology”
2017: Research project “Understanding the role of FEZ2 in neurons”

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School

Ilona Vieten

EDUCATION

College / University:
Universität zu Köln, Germany

Highest Degree:
B.Sc.

Major Subjects:
Neuroscience

Lab Experience:
ELISA, immunohistochemistry, DNA isolation, PCR, SDS-page, Western Blot, basic cell culture techniques, basic mouse handling and perfusion fixation, cryostat and vibratome sectioning, light and confocal microscopy.

Projects / Research:
2020: Internship at Centrosome and Cytoskeleton Biology Laboratory, Heinrich Heine University Düsseldorf, Germany
2019: “Interaction Between Short-chain Polysialic acid and Sialic acid-binding Ig-like Lectins (SIGLEC)s”, Bachelor’s thesis at the Institute of Reconstructive Neurobiology, University of Bonn, Germany
2018: Internship at Translational Neurocircuitry Group of Max Planck Institute for Metabolism Research, Cologne, Germany

Scholarships:
2020 – 2021: Stipend by the International Max Planck Research School
Margaret Young

EDUCATION

College / University:
Northwestern University

Highest Degree:
Bachelor of Arts

Major Subjects:
Neuroscience

Lab Experience:
My undergraduate research exposed me to optogenetic inactivation and electromyography recordings in mice and behavioral assays and quantification (data analysis, including dimensionality reduction and statistical tests, in MATLAB and Python and video labelling in DeepLabCut). However, I also completed undergraduate coursework that focused on machine learning and mathematical modelling techniques in Python, on electrophysiological recordings in Aplysia ganglia, and on other molecular techniques, including Western blotting, immunohistochemistry, and PCR.

Projects / Research:
2019 – 2020: Undergraduate researcher with Dr. Andrew Miri in the Neurobiology Department at Northwestern University. My work culminated in my Bachelor’s thesis titled “A Quantitative Analysis of Cortical Influence on Complex Movement in Real Time.”

Scholarships:
2020 – 2022: Gold Neurasmus Excellence Scholarship (NExS)
2020 – 2021: Stipend by International Max Planck Research School
2019 – 2020: NEURON Program Participant, Department of Neurobiology at Northwestern University
Summer 2019: Neuroscience Summer Research Grant, Department of Neurobiology at Northwestern University

Andrea Antal

Professor at the Clinical Neurophysiology

- 1990 Diploma in Biology, Attila József University of Sciences, Szeged, Hungary
- 1993 University Doctor, Attila József University of Sciences, Szeged, Hungary
- 1998 Ph.D., Albert Szent-Györgyi Medical University, Szeged, Hungary
- 2005 Habilitation University of Göttingen, Germany
- 2010 Extraordinary professor, University of Göttingen, Germany

Major Research Interests

Neuroplasticity became one central topic of neuroscience research in the last decades. Dynamic modifications of neuronal networks are an important substrate for learning and memory formation. Furthermore, pathological neuroplasticity might be one foundation of numerous central nervous system diseases.

The primary aim of our recent work is to develop and establish new non-invasive brain stimulation methods to induce physiological changes in the central nervous system in order to investigate cognition and complex information processing. Transcranial direct current stimulation (tDCS) was developed by our group as a non-invasive tool to induce neuroplasticity in the human cerebral cortex. tDCS as a tool aims to induce prolonged neuronal excitability and activity alterations in the human brain via alterations of the neuronal membrane potential. Accordingly, this method is a promising tool in the treatment of diseases that are accompanied by changes of cortical excitability. Transcranial alternating current stimulation (tACS) and random noise stimulation (tRNS) are new external stimulation techniques influencing cortical activity. tACS and tRNS permit, due to the oscillating stimulation, external interference with the cortical oscillations. They can particularly modulate the temporary connections of cortical areas during a given task. Neuronal oscillations in the brain are associated with the processing of sensory information, learning, cognition, arousal, attention and also pathological conditions (e.g. Parkinson’s tremor, epilepsy). Therefore, the external modulation of cortical oscillations could be an important component of induced cerebral plasticity. In terms of effectiveness tRNS seems to have at least the same therapeutic potential for the treatment of diseases such as depression and chronic pain as rTMS and tDCS.

Mathias Bähr

Professor of Neurology

- 1985 MD, University of Tübingen Medical School, Training in Neurology at University Hospitals in Tübingen and Düsseldorf
- DFG and Max Planck Fellow at the Max Planck Institute for Developmental Biology Tübingen and at the Department of Anatomy and Cell Biology, Washington University St. Louis
- Schilling-Foundation Professor for Clinical and Experimental Neurology, University of Tübingen
- since 2001 Director at the Department of Neurology, University of Göttingen

Major Research Interests

Our research examines cellular and molecular mechanisms of neuronal dysfunction and neuronal cell death in neurodegenerative disorders focusing on Parkinson’s disease (PD). In a translational approach we use several models to study pathophysiological cascades, potential biomarkers and develop new therapeutic strategies.

In the Excellence Cluster MBExC we cooperate with several other groups of the Göttingen Campus to determine the role of a-synuclein aggregation for dopaminergic dysfunction and cell death. To that end, we have recently also established new differentiation protocols for iPSC cells from idiopathic and genetic PD patients. In all our model systems we use AAV-mediated viral gene transfer to express different disease-or de-/regeneration associated genes as research tools and also as potential therapeutic factors to manipulate the respective molecular events in vitro and in vivo. In parallel, we examine the pathophysiology in PD patients and develop new diagnostic and prognostic biomarkers.

Final aim of our research approaches is to describe in detail the molecular pathophysiology that leads to axonal and neuronal loss and to develop new therapeutic strategies, some of which have already been translated into proof of concept studies in human patients.

Selected Recent Publications

Thomas Bayer

Professor of Molecular Psychiatry

- 1984 – 1989 Diploma in biology, University of Stuttgart and Whitney Lab Florida
- 1989 – 1993 PhD at the University of Cologne (PhD Thyssen Graduate School)
- 1993 Postdoctoral Research Fellow, University of Cologne, Cologne

- 2007 – present University Professor in “Molecular Psychiatry” at the University of Göttingen, University Medical Center Göttingen
- Personal tutor of the Studienstiftung at the University of Göttingen

Major Research Interests

Pathogenesis of Alzheimer’s disease, neuronal cell death mechanisms, preclinical proof-of-concept studies; characterization and development of mouse models for Alzheimer’s disease (neuropathology, anatomy, biochemistry, behavioural tests), preclinical therapy studies in mouse models, blood and CSF biomarker analysis, coordination and design of a phase II clinical study with Alzheimer’s disease patients.

Selected Recent Publications

Susann Boretius

Professor of Functional Imaging at the German Primate Center

- 1994 License to practice veterinary medicine
- 2000 Doctor of veterinary medicine, University of Leipzig
- 2003 Diploma in Physics, University of Göttingen
- 2003 – 2011 Scientific assistant, Max-Planck-Institute for Biophysical Chemistry, Göttingen, Biomedizinische NMR Forschungs GmbH (Prof. J. Frahm)
- 2011 – 2015 Professor of Biomedical Imaging with focus on magnetic resonance technologies, Christian-Albrechts University of Kiel, Germany
- 2013 – 2015 Head of the Molecular Imaging North Competence Center, Christian-Albrechts University of Kiel
- since 2015 Professor of Functional Imaging, Faculty of Biology and Psychology, University of Göttingen and head of the Functional Imaging Laboratory, German Primate Center, Göttingen

Major Research Interests

Magnetic resonance imaging (MRI) and spectroscopy (MRS) Neurosciences: basic and translational research

Our research is focused on the development and improvement of magnetic resonance (MR) methods for application in basic biomedical and applied clinical research especially in the fields of neurosciences. We are particularly interested in applying this method on experimental animals, but we do complementary studies in humans as well. As truly non-invasive techniques, MRI and MRS are important methods for translational research, because almost the same methods can be applied in animals and humans. In this context, our research and development activities aim to continuously improve the spatial and temporal resolution of MRI and MRS in rodents, in non-human primates and in humans. With the help of these techniques we are “watching” the brain while it thinks and aiming to better understand what happens with the brain during maturation and aging, and under healthy and pathological conditions as well. Moreover, by using appropriate animal models and more advanced contrast mechanisms like diffusion-based techniques, magnetization transfer and susceptibility mapping our goal is to increase the sensitivity and specificity of these MR methods for more precise diagnostics and for a more specific and early detection of the response to therapeutic intervention.

Selected Recent Publications

- 1981 – 1985 Undergraduate studies in Biochemistry, Eberhard Karls University, Tübingen, Germany
- 1987 MSc in Physiology with Marianne Fillenz, University of Oxford, Oxford, UK
- 1990 PhD in Biology with Reinhard Jahn, Ludwig Maximilians University, Munich, Germany
- 1991 – 1995 Postdoctoral training with Stephen F. Heinemann (Salk Institute, La Jolla, CA, USA) and Thomas C. Südhof (University of Texas Southwestern Medical Center, Dallas, TX, USA)
- 1995 – 2001 Research Group Leader, Max Planck Institute of Experimental Medicine, Göttingen, Germany
- since 2001 Director, Department of Molecular Neurobiology, Max Planck Institute of Experimental Medicine, Göttingen, Germany

Major Research Interests

Our research focuses on the molecular mechanisms of nerve cell development and synapse formation and function in the vertebrate central nervous system. To this end, we combine biochemical, morphological, mouse genetic, physiological, and behavioral methods to elucidate the molecular basis of nerve cell differentiation, synapse formation, transmitter release, and postsynaptic transmitter sensing. In selected cases, we explore the dysfunction of corresponding biological processes in neuropsychiatric diseases. Our work in the field of nerve cell development focuses on the role of SUMOylation in cell polarity formation, cell migration, and neuritogenesis, our synaptogenesis research concentrates on synaptic cell adhesion proteins and their role in synapse formation and function, and our studies on the molecular mechanisms of neurotransmitter release focus on components of the presynaptic active zone and their regulatory function in synaptic vesicle fusion.

  (GZMB)
- 2004 – 2006 Postdoc University of Göttingen, Germany

Major Research Interests

Head Development and Evolution

We seek to understand the formation of the insect head from pattern formation to
morphogenesis. These data provide insights into some long standing zoological ques-
tion concerning the arthropod head and its evolution.

Brain Development and Evolution

We want to identify the cellular and genetic mechanisms that underly the evolution of
the astonishing diversity of insect brains. Further, we identify the genetic signals speci-
fying neural stem cells of the brain. We focus on the central complex as model.

Insect Functional Genomics

We expand the power of our model system by developing novel tools. Transgenic tools
and CRISPR/Cas9 genome editing allow a deeper analysis of gene function. The genome
wide iBeetle RNAi screen reveals novel gene functions.

• 2012 – 2017 Postdoctoral Fellow, Princeton University
• since 2017 Group leader, European Neuroscience Institute

Major Research Interests

The “Neural Computation and Behavior” works on how acoustic communication signals are processed to inform behavior. Acoustic communication is widespread in the animal kingdom - yet it’s neural basis is only poorly understood. Like songbirds or crickets - fruit flies also produce mating songs during courtship. We use high-throughput behavioral assays and computer vision to precisely quantify how song influences behavior on multiple time scales – from changes in locomotion in response to the song over tens of milliseconds to a mating decision based on song accumulated over several minutes of courtship. We then exploit the genetic toolbox available in Drosophila to identify the neural substrates of these behaviors: Using optogenetics, we activate or inactivate individual neurons in the fly brain during courtship interactions – quantitative models of the behavior then allow us to identify the time scales and components of the behavior controlled by these neurons. Having found individual neurons involved in processing song, we then use electrophysiology and two-photon Calcium imaging to interrogate the dynamical neural representations of song to determine how song is encoded in the brain and how these neural codes give rise to behavior.

Selected Recent Publications

Peter Dechent

Research Group Leader, Cognitive Neurology

- 1991 – 2001 Studies of Biology, University of Mainz
- 1994 Scientific Assistant at the Biophysical Institute, University of Mainz
- 1996 Research Fellow at the Neuroscience Department, Karolinska Institute, Stockholm, Sweden
- 1997 – 1998 Diploma Thesis at the ‘Biomedical NMR Research’ at the Max-Planck-Institute for Biophysical Chemistry, Göttingen; Diploma in Biology
- 1998 – 2001 Doctoral thesis at the ‘Biomedical NMR Research’; Dr.rer.nat. (Biology)
- 2001 – 2003 Postdoc at the ‘Biomedical NMR Research’ (Laboratory of Prof. Dr. J. Frahm)
- since 2004 Head of the Research Group ‘MR-Research in Neurology and Psychiatry’ Medical Faculty, University Göttingen

Major Research Interests

- Combination of functional magnetic resonance imaging (fMRI) with non-invasive brain stimulation techniques like transcranial Direct / Alternating Current Stimulation (tDCS/tACS) and Transcranial Magnetic Stimulation (TMS) to modulate functional brain networks in healthy and pathologic conditions.
- Characterization of hemodynamic processes, the basis of blood oxygenation level dependent (BOLD) changes in standard fMRI investigations.
- Application of modern MR techniques to investigate the human brain in healthy and pathologic conditions. Applied methods comprise:
  - Structural MRI
  - Diffusion-weighted- and diffusion-tensor-imaging (DWI/DTI)
  - Localized MR-spectroscopy (MRS)

Selected Recent Publications

Thomas Dresbach

Professor of Anatomy

- 1996 Dr. rer. nat. (Biology), University of Bonn
- 1997 – 2003 DFG research fellow and postdoctoral Fellow with E. Gundelfinger at the Leibniz Institute for Neurobiology
- 2003 – 2010 Teacher and independent research group leader at the University of Heidelberg, Institute for Anatomy and Cell Biology (Dept. Prof. Dr. J. Kirsch)
- 2010 Professor at the School of Medicine, University of Göttingen

Major Research Interests

Our group studies synapse formation with particular focus on the biogenesis of presynaptic nerve terminals. Our goal is to understand the mechanisms of synaptogenesis in enough detail to pinpoint molecular causes of synaptopathies. We study neuronal cultures to unravel fundamental mechanisms operating at the heart of synaptogenesis, and we have begun to study specialized synapses such as the giant synapses of the mammalian auditory system to determine how these mechanisms act together to gene-rate the remarkable specification and heterogeneity of synapses in the brain.

Using live imaging, molecular biological and ultrastructural approaches, we currently analyze
- the role of novel, vertebrate-specific presynaptic proteins in synaptic function
- the trafficking and assembly of synaptic organelles and protein complexes
- the transsynaptic signalling events controlling presynaptic differentiation.

These efforts should help us understand both the common principles by which the various types of synapses are generated, and how they are fine-tuned for specific tasks, such as a particular strength, reliability or adaptivity.

- 2008 Professor of Molecular Neurobiology of Behavior, University of Göttingen

**Major Research Interests**

We study neuronal mechanisms underlying olfaction, learning and memory, and goal-directed behavior using the model organism *Drosophila melanogaster*. The fruit fly *Drosophila* offers the advantage of expressing transgenes in almost any population of its about 100,000 neurons. Transgenes used by us are, for example, fluorescent sensor proteins that allow us to monitor the spatio-temporal activity of neurons, or light-sensitive proteins by which neuronal activity can be stimulated through illumination. Using these optogenetic techniques in combination with behavioral analyses we aim at unraveling the functioning of dedicated neuronal circuits, and how these circuits contribute to organizing behavior. In addition, molecular mechanisms underlying learning and memory processes are investigated.

- since 2011 W3 Professor at the Department for Psychiatry and Psychotherapy, University Medical Center Göttingen
- since 2011 Speaker of the German Center for Neurodegenerative Diseases (DZNE) site Göttingen

Major Research Interests

The long-term goal of our research is to understand the cellular and molecular mechanisms underlying brain diseases and to develop neuroprotective and neurodegenerative therapeutic approaches. There is now accumulating evidence that on an individual level health or disease critically depends on the interaction between genes and environment. Epigenetic mechanisms such as histone-modification, DNA-methylation and non-coding RNA-mediated processes are key-regulators of gene-environment interactions. Importantly, such epigenetic mechanisms have recently been implicated with the pathogenesis of neurodegenerative and psychiatric diseases. Thus our current hypothesis is that deregualtion of genome-environment interactions, especially via epigenetic gene-expression, is a key feature of neurodegenerative diseases such as Alzheimer’s disease. We combine studies in patient material, mouse and cellular models, behavioral, molecular, genetic, and bioinformatic techniques to address these questions.

Alexander Flügel

Professor of Neuroimmunology

- 1993 MD Ludwig-Maximilians-University (LMU) Munich
- 2002 – 2007 Group leader at the Institute of Neuroimmunology, Max-Planck-Institute for Neurobiology, Martinsried, Munich
- 2008 Associate professor for Experimental Immunology at the Institute for Immunology, LMU Munich
- since 12/2008 Full professor and director of the Institute for Neuroimmunology and Multiple Sclerosis Research, University of Göttingen

Major Research Interests

- Neuroimmunology
- T cell biology
- Intravital imaging

The focus of my interest lies on the mechanisms and factors that allow T cells to enter the central nervous system, to communicate in this milieu and to influence the brain tissue.

My colleagues and I pursue the following aims, i) development of new models and tools to study CNS autoimmunity; ii) revealing the basics of pathogenesis in (auto-)immune diseases of the nervous system; iii) deducing and developing new therapeutical approaches; and iv) analyzing the mechanisms of action for (adverse) effects of new therapeutical procedures.

• 2004 PhD in Biophysics, Humboldt University Berlin
• 2004 – 2007 Postdoctoral Researcher, Harvard University, Dept. of Molecular and Cellular Biology
• 2007 – 2010 Max Planck Research Group Leader, Max Planck Institute of Neurobiology, Munich-Martinsried
• since 2010 Professor for Sensory Processing in the Retina, School of Medicine, University of Göttingen

Major Research Interests

We are interested in how the neuronal network of the retina processes visual information. The focus of our work is on studying the function of the various neuron types in the retina and their synaptic connections. One goal is to better understand the “neural code” of the retina: how do the patterns of electrical activity in retinal neurons transmit information about the visual environment to downstream brain areas? Another goal is to better understand “neural computation” in the retina: how do the cells in the retinal network work, adapt, and interact to produce specific, useful responses? On the basis of these questions, we also study how dysfunction of the retinal circuitry, for example in retinal diseases, compromises sensory processing and how optogenetics can be used to artificially stimulate retinal neurons for vision restoration when photoreceptors are degenerating.

Our investigations are based on various techniques of recording the activity of neurons in the retina while stimulating the network with visual images or movies. To do so, we use isolated retinas of mice and salamanders and apply extracellular multi-electrode array recordings and intracellular recordings with glass pipettes. A central theme of our work is to combine the experiments with novel tools of data analysis and with mathematical modeling of the signal processing in the retina.

- 2008 Associate Professor for Molecular Biology and Biophysics of Sensory Systems, University of Cologne
- 2008 Full Professor for Cellular Neurobiology, University of Göttingen

Major Research Interests

Our group studies fundamental processes in hearing. By combining mechanical measurements with genetics, molecular biology, immunohistochemistry, electrophysiology, calcium imaging, and biophysical modelling, we are trying to decipher how molecular processes shape the performance of an ear. Our preferred model system is the hearing organ of the fruit fly Drosophila melanogaster, the auditory sensory cells of which share conserved molecular modules with the hair cells in our ears.

Our work has uncovered striking parallels between fly and vertebrate hearing, including the functional equivalence of the auditory transduction and adaptation machinery, the motility of auditory sensory cells, transducer-based force generation, and the expression of homologous genes. Our work also provided first insights into the diverse roles of –and interactions between– transient receptor potential (TRP) ion channels in hearing, and a model of TRP-function in the fly’s auditory system has been devised. Using a novel electrostatic actuation method, we were able to identify hair cell-like signatures of transducer gating and adaptation in the fly’s auditory mechanics and could show that a simple transduction model as proposed to describe hair cell mechanics comprehensively explains the macroscopic behaviour of an ear. Based on these findings, we are currently devising a computational model that allows for the high-throughput characterisation of genetic hearing defects. Candidate genes for hearing, in turn, are narrowed down by expression profiling using whole-genome microarrays. By testing how these genes contribute to auditory function and performance, we aim for a comprehensive molecules-to-system description of the functional workings of an ear.

Major Research Interests

Vertebrates and invertebrates evolved from common ancestors that already possessed neurons, neurosecretory systems and structured central nervous systems. Though nervous systems of invertebrates are typically less complex than those of vertebrates (especially mammals) they share many molecular and functional characteristics. We study the neural basis of insect behaviors and mechanisms underlying neuroprotection and neuroregeneration in insect nervous systems with an evolutionary perspective.

1) The cytokine erythropoietin (Epo) mediates neuroprotective and neuroregenerative functions in insects similar to its beneficial effects described in mammals including humans. Similar structural and functional characteristics of the Epo-binding receptors, partly shared transduction pathways that prevent apoptosis and the functional implication in neuroprotective and neuroregenerative processes in both mammalian and insect species suggest that Epo-like signaling was already established in their common ancestors. We study insects, both with in vitro and in vivo approaches, to identify “ancient” Epo-like signals and their cell-protective receptors and to characterize their functions when animals face environmental and/or physiological challenges.

2) Apoptosis plays a major role in development, tissue renewal and the progression of degenerative diseases. Similar molecular players and mechanisms in vertebrates and invertebrates indicated that the complex “mammalian-like” apoptosis regulatory network was already present in early metazoans. Our recent studies identified the pro-apoptotic function of insect acetylcholinesterase as another shared characteristic between vertebrate and insect apoptosis.

3) Social behavior is the product of complex interactions between various types of neurons that integrate external sensory information with internal physiological states. We study the regulation of insect social behaviors by synaptic molecules (e.g. neuroligins, transmitters) and the neurochemical mechanisms of motivational states with a combination of neuroethological, pharmacological, electrophysiological, histochemical and immunocytochemical methods.

Major Research Interests

Our group is interested in the mechanisms of membrane fusion, with the main emphasis on regulated exocytosis in neurons. Intracellular membrane fusion events are mediated by a set of conserved membrane proteins, termed SNAREs. For fusion to occur, complementary sets of SNAREs need to be present on both of the fusing membranes, which then assemble in a zipper-like fashion to initiate membrane merger. The neuronal SNAREs are among the best characterized. They are the targets of the toxins responsible for botulism and tetanus, and they are regulated by several additional proteins including synaptotagmin, the calcium sensor for neurotransmitter release. To understand how these proteins mediate fusion, we study their properties in vitro with biochemical and biophysical approaches using native and artificial membranes.

In a second set of projects, we are interested in the mechanisms by which synaptic vesicles sequester and store neurotransmitters. Uptake is mediated by specific vesicular neurotransmitter transporters that are energized by an electrochemical proton gradient across the membrane. Presently we aim for a better understanding of the transport mechanisms using a variety of biochemical and biophysical approaches including imaging of single vesicles. Finally, we use quantitative proteomics to better understand how the presynaptic protein network contributes to the regulation of synaptic release, focusing on protein phosphorylation.

- since 2010 Full Professor of Systems Neuroscience, Institute for Zoology and Anthropology, University of Göttingen

Major Research Interests

The Löwel lab is focussed on understanding the development and plasticity of neuronal circuits in the mammalian cortex. We use a combination of techniques, including optical imaging, 2-photon imaging, electrophysiology and virus-mediated knock-down to explore how experience and learning influence the structure and function of nerve cell networks. We hope that answering these key questions not only helps to understand the rules underlying brain development, functioning and learning but additionally will open up new avenues to develop clinically relevant concepts to promote regeneration and rehabilitation for diseased and injured brains. The Löwel lab has made major contributions to experience-dependent changes in nerve cell networks: We were e.g. the first to demonstrate that the learning rule for the development of long-range cortical circuits is correlated activity: “neurons wire together if they fire together” (Löwel & Singer, 1992, Science 255: 209-212).

Major Research Interests

Auditory Neuroscience - Synaptic Physiology and Pathophysiology – Audiology and Neuroprosthetics

Our work focuses on the molecular anatomy, physiology and pathophysiology of sound encoding and information processing in the auditory system as well as the restoration of hearing by gene replacement therapy and optogenetic stimulation. We combine various techniques to characterize synapses of hair cells and the auditory brainstem from the molecular to the systems level. This way we have contributed to the understanding of structure and function of auditory synapses and initiated the concept of auditory synaptopathy. Towards restoration of hearing we aim to establish virus-mediated gene replacement therapy of auditory synaptopathy and pursue the optogenetic stimulation of auditory nerve for improving the performance of the cochlear implant.

Major Research Interests

We are studying the interactions of neurons and glial cells in the mammalian nervous system with a special interest in the role of oligodendrocytes and Schwann cells, best known as myelin forming cells of the central and peripheral nervous system. These highly specialized glial cells enwrap axons with a multilayered sheath that provides electrical insulation for rapid impulse propagation. However the biology of these axon-glia interactions is complex. Using mouse genetics, originally to study the role of proteins in the myelin architecture and in neurogenetic disorders, we made the unexpected discovery of a novel function of oligodendrocytes, which even precedes myelin in nervous system evolution: the glial metabolic support of axonal conduction, axonal transport and long-term integrity. We determined that oligodendrocytes and Schwann cells take up glucose and deliver lactate, here the product of aerobic glycolysis, to the axonal compartment. This supportive function helps maintaining axon functions especially when ATP demands are increased at higher firing rates, also because access of axons to extracellular metabolites is restricted by myelin itself. Here, the fine architecture of the myelin sheath that we visualize with advanced electron microscopic techniques appears critical. Specialized cytoplasmic connections within the myelin sheath (‘myelinic nanochannels’) must provide a pathway of continuous communication between oligodendrocytes and the encapsulated axon. In neurological diseases, in which myelin is structurally affected or even destroyed, such as in multiple sponges, leukodystrophies and various peripheral neuropathies, there is invariably secondary axonal degeneration that we propose is caused by the lack of adequate metabolic support. We are investigating the underlying molecular mechanisms of these diseases in detail, using corresponding animal models that we have generated with a range of genetic techniques. A further goal is to understand the role of myelinating glial cells in higher brain functions and psychiatric diseases, which we approach in close collaboration with the Department of Hannelore Ehrenreich at our institute.

- 2010 – present: Full Professor of Aggregopathies, Director of the Department of Neurodegeneration and Restaurative Research, University Medical Center Göttingen

Major Research Interests

Our research interests are focused on the understanding of the molecular mechanisms which lead to neurodegeneration in diseases such as Parkinson’s, Huntington’s, or Alzheimer’s disease. These diseases are intimately associated with protein misfolding and aggregation in specific regions of the brain.

Because the molecular pathways involved in protein homeostasis are highly conserved, we employ a wide variety of model organisms, from the simple but powerful budding yeast to mammalian cell culture and mice, to study the origin of the problems. We are also developing novel in vivo imaging approaches based on multi-photon microscopy to observe protein misfolding and aggregation in the living brain.

Our ultimate goals are to develop novel therapeutic approaches for these and other related disorders. We are working closely together with clinicians in order to accelerate drug discovery efforts, translating basic research into clinical applications that will improve the lives of patients.

Major Research Interests

Our research interest focuses on the role of ion channels in the initiation and progression of tumors. For this, we take advantage of the knowledge of the physiology and molecular biology of channels and use electrophysiological techniques along with advanced microscopy, protein engineering and animal models. Most of our work has been on a particular potassium channel frequently expressed (75%) in human tumors. We try to take advantage of the particular features of ion channels (for example, their surface expression) to design novel diagnostic and therapeutic procedures.

We also try to understand the mechanisms underlying the role of ion channels in tumors, regarding both permeation properties as well as non-canonical functions.

• 1992 Prof. and Head of the Department of Clinical Neurophysiology

Major Research Interests

We intend to understand and modulate cortical plasticity in man. This is mainly done on a behavioural, imaging and electrophysiological level. We use (motor) learning paradigms, evaluate them by behavioural techniques and by recording EMG; EEG or fMRI data in the context with connectivity analyses. We develop and/or apply stimulation techniques such as repetitive transcranial magnetic stimulation (rTMS), transcranial direct current stimulation, alternating current stimulation or random noise stimulation (tDCS, tACS, tRNS). TMS induces a short electric current in the human brain. Both rTMS and electric stimulation techniques offer the prospect of inducing LTD and LTP like effects in the human brain. Diseases in our focus are Parkinson’s disease, epilepsy, migraine, stroke and dystonia.

The Department of Clinical Neurophysiology pursues other research areas such as Neurorehabilitation in conjunction with the Bernstein Centre of Computational Neuroscience and with the Company Otto Bock. Another focus concerns Hereditary Neuropathies in collaboration with the MPI for Experimental Medicine, speech disorders with a focus on stuttering and others (overview researcher ID A-3544-2009).

Major Research Interests

We study that signaling between nerve cells in the brain is mainly mediated at synapses, which are specialized cellular contact sites. The transfer of information at synapses can be regulated dynamically, a process that is called synaptic plasticity. Our main research goal is to elucidate the molecular mechanisms that underlie synaptic plasticity at synapses in the central nervous system. For this purpose we mainly use electrophysiological methods, in combination with nerve cells from genetically modified mice or virus-mediated molecular perturbation of nerve cell function.

Neurotransmitter release is the first step in synaptic signaling. It is mediated by exocytosis of synaptic vesicles at highly specialized contact sites, the active zones of synapses. Neurotransmitters are stored in synaptic vesicles, which undergo a complex trafficking cycle in the presynaptic compartment in order to sustain the rapid and repetitive transfer of information between nerve cells. Synaptic vesicles are initially tethered at the active zone plasma membrane, a process termed docking. Subsequently vesicles undergo a prefusion reaction termed priming, which renders docked vesicles fusion competent, thus defining the readily releasable pool of vesicles. Triggered by the arrival of an action potential at the nerve terminal and the concomitant increase in the intracellular Ca$^{2+}$ concentration, a fraction of fusion competent vesicles in the readily releasable pool fuse with the plasma membrane and release their content. After fusion, vesicular membrane and protein components are recycled by endocytosis and used for additional rounds of exocytosis.

Essentially, each step of the synaptic vesicle cycle can contribute to the regulation of synaptic plasticity. We combine mouse genetics, molecular biological and morphological methods, and patch clamp electrophysiological analyses of autaptic cultured neurons, organotypic brain slice cultures, acute brain slices, or acutely isolated neurons with active presynaptic terminals in order to identify the molecular mechanisms underlying the individual synaptic vesicle recycling steps. In the past, we characterized mutant mice lacking identified presynaptic protein components of the neurotransmitter release machinery. Experiments on mutant mouse neurons are complemented by virus mediated expression of proteins in cultured neurons, which allows us to perform detailed structure-function analyses of presynaptic proteins.

- 2012 – 2014 Professor (W3), University Medical Center Göttingen
- 2014 – Director of the Department of Neuro- and Sensory Physiology, University Medical Center Göttingen

Major Research Interests

Conventional fluorescence microscopy is limited by the diffraction of light: fluorescent objects that are close together cannot be discerned. Stimulated emission depletion (STED) is a recent advancement in optical physics that breaks the diffraction barrier, allowing microscopes to obtain much clearer images.

The diffraction barrier has been particularly problematic for imaging synaptic vesicles, which are among the smallest known organelles (30-50 nm in diameter). They are located in small areas in the synapses (about 1 micron in diameter). The group takes advantage of the increased imaging resolution provided by STED to investigate synaptic vesicle function, with an emphasis on synaptic vesicle recycling. Since STED microscopy also allows imaging of protein domains, the group aims at studying the patterning of protein domains in the synapse, in order to understand its molecular architecture.

- 2010 Invited Junior Professor of Affective Neuroscience, Swiss Center for Affective Sciences (CISA), University of Geneva
- 2010 Visiting Professor of Cognitive Neuroscience, Institute of Psychology, Humboldt-Universität zu Berlin
- 2011 Habilitation (venia legendi) in Psychology (HU Berlin)
- since 10/2010 Junior Professor (tenure track), Courant Research Centre “Text Structures”, University of Goettingen
- since 2016 Professor of Affective Neuroscience and Psychophysiology, Institute of Psychology, University of Goettingen

Major Research Interests

Our main research activities focus on the interplay of cognition and emotion in several domains of human information processing, including faces and written and spoken language. Our work aims to identify the specification of the origins, dynamics, and boundary conditions of emotion effects within and between different stimulus domains and modalities, as well as to better define the emotional outcomes of cognitive operations. In order to answer our research questions, we employ a combination of well-established experimental paradigms with several psychophysiological measures, including event-related brain potentials (ERPs), eye movements, electrodermal and respiratory activity, facial muscle activity (via EMG recordings), and changes of pupil diameter.

Research areas:
- Affective and motivational impacts on visual sensory processing
- Emotion-cognition interplay in the processing of written and spoken language
- Face processing, including emotional expressions, attractiveness, and face identity
- Audiovisual integration of social signals in human communication

- 2000 – 2004 Senior Postdoctoral Fellow, California Institute of Technology
- 2004 – 2009 Work group leader, Institute of Neuroinformatics, ETH / University of Zürich, Switzerland
- since 2008 Professor for Primate Neurobiology, University of Göttingen and Deutsches Primatenzentrum GmbH

Major Research Interests

We are interested in how hand movements are generated in the primate brain and how intentions to grasp objects can be decoded for controlling a neural prosthesis. For this, we investigate the cortical representation of hand movements in motor-related cortical areas and their relation to sensory systems and decision making. Furthermore, we are developing brain-machine interfaces that can read out such movement intentions to control robotic devices. Such systems could be useful for future applications aiming to restore hand function in paralyzed patients.

- 2006 – 2015 Independent group leader (Emmy-Noether/DFG) at the European Neuroscience Institute Göttingen (ENI-G), since 2006
- Assistant Professor at the Department of Neuroscience, University of Pittsburgh, since 2015
- since 2016 Adjunct Professor at the Department of Psychiatry and Psychotherapy, University Medical Center Göttingen

Major Research Interests

Activity-dependent modulations of synaptic transmission are important mechanisms of information processing and storage in neuronal circuits. A variety of related but mechanistically distinct forms of synaptic plasticity have been described in in vitro preparations of brain slices.

A major goal of my laboratory is to elucidate the underlying molecular events, leading to and regulating changes in synaptic efficacy. Newly developed techniques of molecular replacement, using mouse genetics and/or viral-mediated gene transfer allow us to manipulate the molecular composition of single neurons in a spatial and temporal controlled manner.

In particular, we are able to investigate the effects of heterologously expressed proteins on the background of wild-type neurons, or neurons, in which the endogenous protein expression is diminished. We combine this technique with simultaneous dual whole cell patch clamp recordings from rodent brain slices to monitor changes in synaptic efficacy in the manipulated cell in comparison to the neighboring control cell.

Knowledge gained from the understanding of molecular mechanisms of synaptic transmission and plasticity will ultimately provide important clues for the function of neuronal circuits and potentially the functioning of the brain.

- 1997 – 2002 Diploma, Biology, University of Wuerzburg, Germany

Major Research Interests

Research in our laboratory is driven by our motivation to decipher the dynamics of protein networks underlying vertebrate somatosensation in health, development (aging) and disease (chronic pain). Methodologically, we combine molecular biology, biochemistry and latest proteomics techniques, electrophysiology, pharmacology, mouse models of painful pathologies and in vivo virus-mediated gene transfer.

This multidisciplinary approach has enabled us to reveal ion channel-associated signaling complexes (i.e. the interactome of TRPV1, TRPA1 and Piezo2 channels) with pathological relevance for pain. Moreover, in a quantitative systems biology approach, we investigate spatiotemporal proteome dynamics both in mice and humans. Our research lives from our fruitful collaborations with basic researchers and clinicians alike facilitating forward and reverse translation of our research results.

In this way we strive to gain mechanistic insights into developmental and pain-associated plasticity – an endeavor, which lies at the heart of both understanding the molecular signature of chronic pain and identifying novel drug targets.

Major Research Interests

Learning is a core building block of intelligent behavior. It endows complex systems with flexibility to adjust to changing environments and with the capacity to generalize to novel situations. We pursue the idea that inroads into understanding learning and generalization can be made in the visual system, where these complex problems can be broken down into tractable hypotheses. Visual processing hierarchies provide an ideal testing ground and offer unique opportunities to unravel the role of feedforward and feedback message passing along the hierarchy as a function of learning and generalization. To this end, we capitalize on combining noninvasive neuroimaging with electrophysiological recordings and causal manipulations of brain activity in non-human primates, and parallel experiments using fMRI in humans. We investigate learning at multiple time scales, from learning effects that build up within seconds to learning effects that take days and weeks to materialize, and across levels of complexity, from learning to discriminate simple visual features to high-level associative and statistical learning. Our overall goal is to determine the neural basis of the visual system’s capacity to learn and generalize through an explicitly comparative approach - a necessary step towards understanding the human mind and its complexity.

Major Research Interests

We pursue a basic research interest in glia cell biology, axon-glia interaction and mechanisms of diseases of the peripheral nervous system (PNS). We have generated a transgenic rat model of the most frequent human neuropathy, Charcot-Marie-Tooth disease type 1A (CMT1A). This disease is associated with a partial duplication of chromosome 17 which leads to an overexpression of the tetraspan protein PMP22. Transgenic “CMT rats” expressing additional copies of this gene share characteristic clinical features of the human disease, including muscle weakness, reduced nerve conduction velocities, and marked Schwann cell hypertrophy resulting in onion bulb formation. The CMT rat allows a better understanding of the cellular disease mechanism operating in human CMT1A, and is helpful in the analysis of modifier genes, epigenetic factors, and in the evaluation of experimental treatment strategies. In an attempt to translate findings from the animal model to humans we were able to identify biomarkers of disease severity in the skin of CMT1A patients, which could already be validated in patients from across Europe. Currently, within CMT-NET, a national BMBF funded network on rare diseases coordinated by Prof. Sereda, we aim at transferring our results from skin to easily accessible blood samples from CMT patients, which would facilitate the performance of clinical trials in the near future.

- 2000 – 2001 Professor of Animal Physiology, University of Tübingen
- 2001 Professor of Cognitive Neuroscience and Biological Psychology, University of Göttingen

Major Research Interests

Research at the Cognitive Neuroscience Laboratory is aimed at understanding the neural basis of visual perception. Vision is an active process that is far more than a passive registration of our environment. Rather, on its way from the eyes to and through the cortex, visual information is modulated by numerous processes that enhance some aspects while diminishing others. One of these processes is attention, i.e. the ability to filter out unwanted information and concentrate the brain’s processing abilities on relevant information.

The accurate representation of visual motion in the environment is one of the most important tasks of the visual system. Correspondingly, research in the laboratory concentrates on this ability as a model for sensory information processing in general.

We use various techniques. While our emphasis is on electrophysiology, i.e. the recording of the activity of neurons in the visual cortex of macaque monkeys and measuring human perceptual abilities with psychophysical methods, we also use theoretical approaches and functional brain imaging.

Using these techniques, we have been able to elucidate how motion information is represented in primate cortical area MT and how attention changes that representation and correspondingly the percept of the visual environment.

- since 2011 Schilling Foundation Professor (W3), Director of the department of Cognitive Neurology and Head of the MR-Research Unit, UKG, University of Göttingen

Major Research Interests

The long-term goal of our research is to understand how neural activity gives rise to spatial awareness and how distributed information is integrated to guide the selection of movement goals. Furthermore we are dedicated to perform translational research from monkey models of cognitive disorders to human patients. Current research focuses on the question how thalamic nuclei and cortical areas interact during visual perception and decision making. Another line of research is concerned with the neural mechanisms underlying spatial neglect, which is a frequent and severe consequence of brain damage in humans. Specifically, we are investigating pathological and compensatory changes in large-scale brain networks in human stroke patients by means of imaging (DTI, fMRI) and stimulation (tACS, tDCS, TMS) methods. We develop and employ monkey models of spatial neglect to study the underlying neural mechanisms by means of fMRI, electrophysiological recordings, inactivation and stimulation techniques with the goal to develop new therapeutic interventions.

- 2014 Habilitation, Medical Faculty of the University of Göttingen, Germany

Major Research Interests

We study the molecular processes underlying neurotransmitter release and the functional consequences of alterations in these processes at the cellular and network levels.

In the past, projects were mainly focused on analyzing the role of vesicular neurotransmitter transporters in neurons as determining factors in the establishment and maintenance of glutamatergic, GABAergic and glycinergic synaptic phenotypes.

Current projects include the analysis of regulatory mechanisms that control the release of non-classical neurotransmitters from large dense-core vesicles in neuroendocrine chromaffin cells and peptidergic neurons.

Major Research Interests

- Theoretical neuroscience and nonlinear dynamics
- Dynamics and synchronization in cortical neural networks
- Function and development of the visual cortex
- Sensory processing in the auditory system

The brains of humans and animals arguably are among the most complex systems in nature. Over the past decade, theoretical neuroscience - the use of quantitative theories, mathematical modelling and advanced quantitative data analysis methods for the study of brain function - has started to provide powerful new approaches for understanding the neuronal basis of perception, learning, memory, and other higher brain functions. This is because, even during the neuronal processing of the most elementary sensory stimulus large ensembles of interacting nerve cells distributed throughout the brain are activated, the collective operations of which are often hard to understand by means of purely qualitative reasoning.

The primary focus of our research in theoretical neuroscience is self-organisation in the dynamics of cortical networks. In particular, we have developed novel approaches to model and predict the dynamics and and neuronal plasticity of the visual cortex. To quantitatively connect theory and experiment in this system, we recently also designed methods that enable to quantify the organization of visual cortical functional architecture with high precision. Another important focus of our work is the mathematical analysis of the dynamics of large and complex networks of pulse-coupled neuron models. The concepts and tools for the representation of the dynamics of cortical circuits developed enable a rational and transparent design of models of higher cortical functions such as the processes underlying perceptual learning phenomena.

- since July 2007 Professor

Major Research Interests

The focus of our research is the regulation and role of the neuronal cytoskeleton in the modulation of neuronal shape and motility during chemotactic processes. The growing neuronal growth cone probes its environment for the chemical composition of its substrate and the presence of neighbouring cells. The former information is sampled by cell adhesion receptors in focal adhesion structures that, next to their sensing function also perform a structural function in that they provide the cell with a means to exert force on its substrate. We are primarily interested in the signal transduction processes that regulate these effects and the cross-talk between the different motility systems.

The main interest areas in this question are; 1. The role and molecular mechanism of lipid raft-resident cell adhesion molecules in the remodelling of the membrane cytoskeleton, 2. Dynamic control of growth cone protein content by local proteolysis and chaperone function during chemotactic responses, 3. Role and mechanism of the neuronal exocyst complex as critical landmarks for dendritic/axonal neuritogenesis.

Our group has a related interest in the pathophysiological mechanism of neurodegeneration by intracellular aggregation of the tau protein, as occurs in Alzheimer’s disease. As tau is an intrinsically unstructured protein that can undergo remarkable conformational changes upon binding to microtubules and in the Alzheimer-related aggregation condition, it presents an ideal model system for the biophysical analysis of protein conformational change and protein interactions.

Our research depends on the development and application of advanced microscopy techniques, primarily; fluorescence lifetime imaging microscopy (FLIM), and Förster resonance energy transfer (FRET) microscopy, in combination with a range of GFP-based optical biosensors and novel bioconjugation approaches for organic dyes, and protein biochemical/molecular biological techniques to resolve and quantify biochemical reactions and conditions in living cells.
